1 About This Document

1.1 Important... Read This Before Proceeding!

It is the responsibility of the machine designer, controls engineer, machine builder, machine operator, and/or maintenance personnel or electrician to apply and maintain this device in full compliance with all applicable regulations and standards. The device can provide the required safeguarding function only if it is properly installed, properly operated, and properly maintained. This manual attempts to provide complete installation, operation, and maintenance instruction. *Reading the manual in its entirety is highly recommended.* Please direct any questions regarding the application or use of the device to Banner Engineering.

For more information regarding U.S. and international institutions that provide safeguarding application and safeguarding device performance standards, see [Standards and Regulations](#) on p. 6.

WARNING:

- The user is responsible for following these instructions.
- **Failure to follow any of these responsibilities may potentially create a dangerous condition that could result in serious injury or death.**
- Carefully read, understand, and comply with all instructions for this device.
- Perform a risk assessment that includes the specific machine guarding application. Guidance on a compliant methodology can be found in ISO 12100 or ANSI B11.0.
- Determine what safeguarding devices and methods are appropriate per the results of the risk assessment and implement per all applicable local, state, and national codes and regulations. See ISO 13849-1, ANSI B11.19, and/or other appropriate standards.
- Verify that the entire safeguarding system (including input devices, control systems, and output devices) is properly configured and installed, operational, and working as intended for the application.
- Periodically re-verify, as needed, that the entire safeguarding system is working as intended for the application.

1.2 Use of Warnings and Cautions

The precautions and statements used throughout this document are indicated by alert symbols and must be followed for the safe use of the EZ-SCREEN 14/30mm Safety Light Curtain. Failure to follow all precautions and alerts may result in unsafe use or operation. The following signal words and alert symbols are defined as follows:

Signal Word	Definition	Symbol
WARNING	Warnings refer to potentially hazardous situations which, if not avoided, could result in serious injury or death.	
CAUTION	Cautions refer to potentially hazardous situations which, if not avoided, could result in minor or moderate injury.	

These statements are intended to inform the machine designer and manufacturer, the end user, and maintenance personnel, how to avoid misapplication and effectively apply the EZ-SCREEN 14/30mm Safety Light Curtain to meet the various safeguarding application requirements. These individuals are responsible to read and abide by these statements.

1.3 EU Declaration of Conformity (DoC)

Banner Engineering Corp. herewith declares that the **EZ-SCREEN Safety Light Curtain** is in conformity with the provisions of the Machinery Directive 2006/42/EC and all essential health and safety requirements have been met.

Representative in EU: Peter Mertens, Managing Director Banner Engineering Europe. Address: Park Lane, Culliganlaan 2F, bus 3, 1831 Diegem, Belgium.

2 Standards and Regulations

The list of standards below is included as a convenience for users of this Banner device. Inclusion of the standards below does not imply that the device complies specifically with any standard, other than those specified in the Specifications section of this manual.

2.1 Applicable U.S. Standards

ANSI B11.0 Safety of Machinery, General Requirements, and Risk Assessment	ANSI B11.15 Pipe, Tube, and Shape Bending Machines
ANSI B11.1 Mechanical Power Presses	ANSI B11.16 Metal Powder Compacting Presses
ANSI B11.2 Hydraulic Power Presses	ANSI B11.17 Horizontal Extrusion Presses
ANSI B11.3 Power Press Brakes	ANSI B11.18 Machinery and Machine Systems for the Processing of Coiled Strip, Sheet, and Plate
ANSI B11.4 Shears	ANSI B11.19 Performance Criteria for Safeguarding
ANSI B11.5 Iron Workers	ANSI B11.20 Manufacturing Systems
ANSI B11.6 Lathes	ANSI B11.21 Machine Tools Using Lasers
ANSI B11.7 Cold Headers and Cold Formers	ANSI B11.22 Numerically Controlled Turning Machines
ANSI B11.8 Drilling, Milling, and Boring	ANSI B11.23 Machining Centers
ANSI B11.9 Grinding Machines	ANSI B11.24 Transfer Machines
ANSI B11.10 Metal Sawing Machines	ANSI/RIA R15.06 Safety Requirements for Industrial Robots and Robot Systems
ANSI B11.11 Gear Cutting Machines	ANSI NFPA 79 Electrical Standard for Industrial Machinery
ANSI B11.12 Roll Forming and Roll Bending Machines	ANSI/PMMI B155.1 Package Machinery and Packaging-Related Converting Machinery — Safety Requirements
ANSI B11.13 Single- and Multiple-Spindle Automatic Bar and Chucking Machines	
ANSI B11.14 Coil Slitting Machines	

2.2 Applicable OSHA Regulations

OSHA Documents listed are part of: Code of Federal Regulations Title 29, Parts 1900 to 1910

OSHA 29 CFR 1910.212 General Requirements for (Guarding of) All Machines

OSHA 29 CFR 1910.147 The Control of Hazardous Energy (lockout/tagout)

OSHA 29 CFR 1910.217 (Guarding of) Mechanical Power Presses

2.3 International/European Standards

EN ISO 12100 Safety of Machinery – General Principles for Design – Risk Assessment and Risk Reduction	EN 60204-1 Electrical Equipment of Machines Part 1: General Requirements
ISO 13857 Safety Distances . . . Upper and Lower Limbs	IEC 61496 Electro-sensitive Protection Equipment
ISO 13850 (EN 418) Emergency Stop Devices, Functional Aspects – Principles for Design	IEC 60529 Degrees of Protection Provided by Enclosures
EN 574 Two-Hand Control Devices – Functional Aspects – Principles for Design	IEC 60947-1 Low Voltage Switchgear – General Rules
IEC 62061 Functional Safety of Safety-Related Electrical, Electronic and Programmable Control Systems	IEC 60947-5-1 Low Voltage Switchgear – Electromechanical Control Circuit Devices
EN ISO 13849-1 Safety-Related Parts of Control Systems	IEC 60947-5-5 Low Voltage Switchgear – Electrical Emergency Stop Device with Mechanical Latching Function
EN 13855 (EN 999) The Positioning of Protective Equipment in Respect to Approach Speeds of Parts of the Human Body	IEC 61508 Functional Safety of Electrical/Electronic/Programmable Electronic Safety-Related Systems
ISO 14119 (EN 1088) Interlocking Devices Associated with Guards – Principles for Design and Selection	IEC 62046 Safety of Machinery – Applications of Protective Equipment to Detect the Presence of Persons

3 Introduction

3.1 Features

- An optoelectronic safeguarding device
- Creates a screen of synchronized, modulated infrared sensing beams; choose from two resolutions, sized in 150 mm (6 in) increments:
 - 14 mm (0.55 in) resolution models with defined areas from 150 mm to 1.8 m (6 in to 71 in)
 - 30 mm (1.18 in) resolution models with defined areas from 150 mm to 2.4 m (6 in to 94.5 in)
- Compact package for smaller production machines robust for large power presses
- Standard or cascadeable models available
- Optional remote Test input terminals for simulating a “blocked” condition (available on some emitter models)
- Reduced Resolution (Floating Blanking) is easily configured
- Three-digit display provides diagnostic information and indicates the number of beams blocked
- Zone indicators identify blocked beams
- FMEA tested to ensure control reliability
- Receiver LEDs provide system status and emitter/receiver alignment indications
- Highly immune to EMI, RFI, ambient light, weld flash, and strobe light
- Two-piece design with External Device Monitoring
- Aux. output option to monitor the state of the OSSDs
- Vibration-tolerant, factory burned-in emitter and receiver circuitry for toughness and dependability
- Up to four pairs of emitters and receivers of different lengths can be cascaded (SLSC.. models)
- Safety PLC input compatible (per OSSD specifications)

3.2 Operating Features

The Banner EZ-SCREEN 14/30mm Safety Light Curtain models described by this manual feature standard functions:

- Reduced Resolution (Floating Blanking) (see [Reduced Resolution/Floating Blanking](#) on p. 37)
- Trip or Latch Output (see [Selectable Trip/Latch Outputs](#) on p. 52)
- External Device Monitoring (EDM) (see [External Device Monitoring](#) on p. 42)
- Auxiliary Output (see [Auxiliary \(Aux.\) Output](#) on p. 43)
- Scan Code (see [System Configuration Settings](#) on p. 50)
- Fixed Blanking (see [Fixed Blanking](#) on p. 37)
- Inverted Display (see [Inverted Display](#) on p. 51)
- Cascading (available on SLPC.. models) (see [Cascade](#) on p. 63)

These functions are configured via DIP switches (behind the access door on the front of each sensor) and/or the sensor wiring configuration. The sensing resolution is determined by the emitter and receiver model.

3.3 System Description

Note: This manual refers to an emitter, its receiver, and their cabling as "a System".

Banner EZ-SCREEN emitters and receivers provide a redundant, microprocessor-controlled, opposed-mode optoelectronic "curtain of light", or "safety light screen". EZ-SCREEN typically is used for point-of-operation safeguarding, and is suited to safeguard a variety of machinery.

The EZ-SCREEN is a two-piece (two-box) system comprising an emitter and a receiver, but no external controller. The external device monitoring (EDM) function ensures the fault detection capability required by EN ISO 13849-1 Categories 3 and 4 without a third box, a controller or a "smart" (self-checking) safety module required of systems without EDM.

The EZ-SCREEN emitters have a row of synchronized modulated infrared (invisible) light-emitting diodes (LEDs) in a compact metal housing. Receivers have a corresponding row of synchronized photodetectors. The light screen created by the emitter and receiver is called the defined area; its width and height are determined by the length of the sensor pair and the distance between them. The maximum range is dependent on the resolution; range decreases if corner mirrors are used. Emitter and receiver pairs with 14 mm (0.55 in) resolution have a maximum range of 6 m (20 ft), and pairs with 30 mm (1.18 in) resolution have a maximum range of 18 m (60 ft).

In typical operation, if any part of an operator's body (or any opaque object) of more than a pre-determined cross section is detected, the solid-state Output Signal Switching Device (OSSD) safety outputs turn OFF. These safety outputs are connected to the guarded machine's Final Switching Devices (FSDs) that control the machine primary control elements (MPCEs), which immediately stop the motion of the guarded machine.

An auxiliary (aux.) output may be used to signal the state of the OSSDs to a process controller (see [External Device Monitoring](#) on p. 42).

Electrical connections are made through M12 (or Euro-style) quick-disconnects. Some emitter models have a 5-pin connector for power and the Test function. Other emitters and all receivers have an 8-pin connector for power, ground, inputs, and outputs.

Functions such as Trip/Latch select, Display Invert, Cascading, Fixed Blanking, Reduced Resolution (Floating Blanking), Scan Code Select, and External Device Monitoring are described in [Features](#) on p. 8. An auxiliary (aux.) output may be used to signal the state of the OSSDs to a process controller. All models require a supply voltage of +24 V dc \pm 15%.

Both emitter and the receiver feature 7-segment diagnostic displays and individual LEDs to provide continuous indication of operating status, configuration, and error conditions.

Figure 1. EZ-SCREEN: Typical Application

3.4 Appropriate Applications and Limitations

WARNING: Read this Section Carefully Before Installing the System

If all mounting, installation, interfacing, and checkout procedures are not followed properly, the Banner device cannot provide the protection for which it was designed. The user is responsible for ensuring that all local, state, and national laws, rules, codes, or regulations relating to the installation and use of this control system in any particular application are satisfied. Ensure that all legal requirements have been met and that all technical installation and maintenance instructions contained in this manual are followed.

The user has the sole responsibility to ensure that this Banner device is installed and interfaced to the guarded machine by Qualified Persons¹, in accordance with this manual and applicable safety regulations. **Failure to follow these instructions could result in serious injury or death.**

¹ A person who, by possession of a recognized degree or certificate of professional training, or who, by extensive knowledge, training and experience, has successfully demonstrated the ability to solve problems relating to the subject matter and work.

The Banner EZ-SCREEN is intended for point-of-operation machine guarding and other safeguarding applications. It is the user's responsibility to verify whether the safeguarding is appropriate for the application and is installed, as instructed by this manual, by a Qualified Person.

The EZ-SCREEN ability to perform its safeguarding function depends upon the appropriateness of the application and upon its proper mechanical and electrical installation and interfacing to the guarded machine. **If all mounting, installation, interfacing, and checkout procedures are not followed properly, the EZ-SCREEN cannot provide the protection for which it was designed.**

WARNING:

- **Install System Only on Appropriate Applications**
- Failure to follow these instructions could result in serious injury or death.
- Use Banner's EZ-SCREEN only on machinery that can be stopped immediately after a stop signal is issued at any point in the machine's stroke or cycle, such as part-revolution clutched machines. Under no circumstances may the EZ-SCREEN be used on full-revolution clutched machinery or in unsuitable applications.
- If there is any doubt about whether or not your machinery is compatible with the EZ-SCREEN, contact Banner Engineering.

3.4.1 Examples: Appropriate Applications

EZ-SCREEN is typically used for, but is not limited to, the following applications:

- Small assembly equipment
- Automated production equipment
- Robotic work cells
- Molding and power presses
- Assembly and packaging machines
- Lean manufacturing systems

3.4.2 Examples: Inappropriate Applications

Do not use EZ-SCREEN in the following applications:

- With any machine that cannot be stopped immediately after a stop signal is issued, such as single-stroke (or full-revolution) clutched machinery
- With any machine with inadequate or inconsistent machine response time and stopping performance
- With any machine that ejects materials or component parts through the defined area
- In any environment that is likely to adversely affect photoelectric sensing efficiency. For example, corrosive chemicals or fluids or unusually severe levels of smoke or dust, if not controlled, may degrade sensing efficiency
- As a tripping device to initiate or reinitiate machine motion (PSDI applications), unless the machine and its control system fully comply with the relevant standard or regulation (see OSHA 29CFR1910.217, ANSI/NFPA 79, ANSI B11.19, ISO 12100, IEC 60204-1, IEC 61496-1, or other appropriate standard)

If an EZ-SCREEN is installed for use as a perimeter guard (where a pass-through hazard may exist, see [Reducing or Eliminating Pass-Through Hazards](#) on p. 24), the dangerous machine motion can be initiated by normal means only after the safeguarded area is clear of individuals and the EZ-SCREEN has been manually reset.

3.5 Control Reliability: Redundancy and Self-Checking

Redundancy requires that EZ-SCREEN circuit components be backed up to the extent that, if the failure of a single component will prevent effective machine stopping action when needed, that component must have a redundant counterpart which will perform the same function. The EZ-SCREEN is designed with redundant microprocessors.

Redundancy must be maintained whenever the EZ-SCREEN is in operation. Because a redundant system is no longer redundant after a component has failed, EZ-SCREEN is designed to monitor itself continuously. A component failure detected by or within the self-checking system causes a stop signal to be sent to the guarded machine and puts the EZ-SCREEN into a Lockout condition.

A recovery from this type of Lockout condition requires:

- Replacement of the failed component (to restore redundancy)
- The appropriate reset procedure

The Diagnostic Display is used to diagnose causes of a Lockout condition. See [Troubleshooting](#) on p. 78.

3.6 Specifications

3.6.1 General Specifications

Short Circuit Protection

All inputs and outputs are protected from short circuits to +24 V dc or dc common

Electrical Safety Class

III (per IEC 61140: 1997)

Safety Rating

Type 4 per IEC 61496-1, -2
 Category 4 PL e per EN ISO13849-1
 SIL3 per IEC 61508; SIL CL3 per IEC 62061
 PFHd: 4.3×10^{-9}

Operating Range

14 mm models: 0.1 m to 6 m (4 in. to 20 ft)

30 mm models: 0.1 m to 18 m (4 in. to 60 ft)

– Range decreases with use of mirrors and/or lens shields:

- Lens shields — approx 10% less range per shield
- Glass-surface mirrors — approx 8% less range per mirror

See the specific mirror datasheet for more information.

Resolution

14 mm or 30 mm, depending on model

Effective Aperture Angle (EAA)

Meets Type 4 requirements per IEC 61496-2
 $\pm 2.5^\circ$ at 3 m

Operating Conditions

0 °C to +55 °C (+32 °F to +131 °F)
 95% maximum relative humidity (non-condensing)

Enclosure

Extruded aluminum housing with yellow polyester powder finish standard (optional black or white or nickel-plated silver finish) and well-sealed, rugged die-cast zinc end caps, acrylic lens cover, copolyester access cover. End caps on silver models are also nickel-plated. ESD-safe models have static-dissipative acrylic lens cover.

Environmental Rating

IEC IP65

Shock and Vibration

Components have passed vibration and shock tests according to IEC 61496-1. This includes vibration (10 cycles) of 10-55 Hz at 0.35 mm (0.014 in) single amplitude (0.70 mm peak-to-peak) and shock of 10 g for 16 milliseconds (6,000 cycles).

Mounting Hardware

Emitter and receiver each are supplied with a pair of swivel end-mounting brackets. Models 1050 mm and longer also include a swivel center-mount bracket. Mounting brackets are 8-gauge cold-rolled steel, black zinc finish.

Cables and Connections

See [Cordsets](#) on p. 17

Certifications

3.6.2 Emitter Specifications

Supply Voltage at the Device

24 V dc $\pm 15\%$ (use a SELV-rated power supply according to EN IEC 60950). The external voltage supply must be capable of buffering brief mains interruptions of 20 ms, as specified in IEC/EN 60204-1.

Residual Ripple

$\pm 10\%$ maximum

Supply Current

100 mA maximum

Status Indicators

One bi-color (Red/Green) Status Indicator: indicates operating mode, lockout or power Off condition
 7-Segment Diagnostic indicator (1 digit): indicates proper operation, scan code, or error code

Wavelength of Emitter Elements

Infrared LEDs, 850 nm at peak emission

Remote Test Input Optional—available only on model SLSE...Q5 emitters

Test mode is activated either by applying a low signal (less than 3 V dc) to emitter TEST#1 terminal for a minimum of 50 milliseconds, or by opening a switch connected between TEST#1 and TEST#2 and +24 V dc for a minimum of 50 milliseconds. Beam scanning stops to simulate a blocked condition. A high signal at TEST#1 deactivates Test mode.
 High Signal: 10 to 30 V dc
 Low Signal: 0 to 3 V dc
 Input Current: 35 mA inrush, 10 mA maximum

Controls and Adjustments

Scan Code Selection: 2-position switch (code 1 or 2). Factory default position is code 1.

3.6.3 Receiver Specifications

Supply Voltage at the Device

24 V dc ±15% (use a SELV-rated power supply according to EN IEC 60950). The external voltage supply must be capable of buffering brief mains interruptions of 20 ms, as specified in IEC/EN 60204-1.

Residual Ripple

±10% maximum

Supply Current (no load)

275 mA maximum, exclusive of OSSD1 and OSSD2 loads (up to additional 0.5 A each)

Response Time

Dependent on the number of sensing beams; see the models table for the number of beams and response time.

CSSI Response Time (SLSC.. cascade models only)

Response time for a cascade receiver due to opening contacts at the cascade interface (CSCI): 40 ms max (contacts must open for 60 ms minimum).

EDM Input

+24 V dc signals from external device contacts can be monitored (one-channel, two-channel, or no monitoring) via EDM1 terminal in the receiver.
 High Signal: 10 to 30 V dc at 30 mA typical
 Low Signal: 0 to 3 V dc
 Dropout Time: 200 ms max.

Recovery Time

Blocked to Clear (OSSDs turn On; varies with total number of sensing beams and whether Sync beam is blocked):

Model	Beam 1 (Sync Beam)	All Other Beams
14 mm	109 ms to 800 ms	33 ms to 220 ms
30 mm	81 ms to 495 ms	25 ms to 152 ms

Reset Input

Reset input must be high for 0.25 to 2 seconds and then low to reset the receiver
 High Signal: 10 to 30 V dc at 30 mA typical
 Low Signal: 0 to 3 V dc
 Closed Switch Time: 0.25 to 2 seconds

Output Signal Switching Devices (OSSDs)

Two redundant solid-state 24 V dc, 0.5 A max. sourcing OSSD (Output Signal Switching Device) safety outputs. (Use optional interface modules for ac or larger dc loads.) Capable of the Banner "Safety Handshake".
 ON-State voltage: ≥ Vin-1.5 V dc
 OFF-State voltage: 1.2 V dc max. (0 to 1.2 V dc)
 Maximum load capacitance: 1.0 µF
 Minimum load inductance: 10 H
 Leakage current: 0.50 mA maximum
 Cable resistance: 10 Ω max.
 OSSD test pulse width: 100 to 300 microseconds typical
 OSSD test pulse period: 10 ms to 27 ms (varies with number of beams)
 Switching current: 0 to 0.5 A

Auxiliary Output Switching Capacity

Current-sourcing (PNP) solid-state output, 24 V dc at 75 mA max.

Controls and Adjustments

Scan Code selection: 2-position switch (code 1 or 2). Factory default position is code 1
 Trip/Latch Output selection: Redundant switches. Factory default position is T (trip).
EDM/MPCE Monitor selection: 2-position switch selects between 1- or 2-channel monitoring. Factory default position is 2-channel monitoring.
 Reduced Resolution: Redundant switches. Factory default position is Off.

Status Indicators

Amber Reset Indicator: indicates whether the System is ready for operation or requires a reset
 Bi-color (red/green) Status indicator: indicates general system and output status
 Bi-color (red/green) Zone Status indicators: indicate condition (clear or blocked beam) of a defined group of beams
 7-Segment Diagnostic indicator (3 digits): indicates proper operation, scan code, error code, or total number of blocked beams

Ambient Light Immunity

10,000 lux at 5° angle of incidence

Strobe Light Immunity

Totally immune to one Federal Signal Corp. "Fireball" model FB2PST strobe

3.6.4 Dimensions

These are the emitter and receiver mounting dimensions and the location of the defined area.

Emitter / Receiver Model	Housing Length L1	Distance Between Bracket Holes		Defined Area ² Y
		L2	L3	
SLS..-150	262 mm (10.3 in)	295 mm (11.6 in)	237 mm (9.3 in)	150 mm (5.9 in)
SLS..-300	372 mm (14.6 in)	405 mm (16.0 in)	347 mm (13.7 in)	300 mm (11.8 in)

3.6.5 End Cap Brackets

Model EZA-MBK-11: End cap brackets are included for emitter or receiver. Dimensions are identical for stainless steel model EZA-MBK-11N for ESD model emitters and receivers.

3.6.6 Center Bracket

Model EZA-MBK-12: The center bracket is supplied with emitters and receivers over 1050 mm (3.4 ft) and longer. Dimensions are identical for stainless steel model EZA-MBK-12N for ESD model emitters and receivers.

² Nominal measurement

4 Components

4.1 System Components

An EZ-SCREEN System includes a compatible emitter and receiver (equal length and resolution; available separately or in pairs), and two cables. Mounting hardware is included with each emitter and receiver. Interfacing solutions include IM-T-.. modules, redundant positively guided contactors, safety modules/controllers, or an optional muting module.

Standard models feature a yellow painted aluminum housing. Other housing finishes are also available, including black, white, and silver (nickel-plated); contact the factory for more information.

Standard models are listed with integral QD fitting; for a 300 mm (12 in) pigtail cable with M12/Euro-style 8-pin QD fitting, replace the “Q” in the model number with “P”. The 13 mm (0.5 in) minimum bend radius accommodates low-clearance installations. When used in a cascade installation, the pigtail models can reduce the number of cables and improve clearance and cable management.

Electro-static dissipative (ESD-safe) models with nickel-plated housing are also available, with a static-dissipative polymer coating that protects nearby components from damaging ESD voltages. ESD-safe models are not available with the pigtail QD option.

Figure 2. EZ-SCREEN Emitter, Receiver, and Two Interconnecting Cables

4.2 Standard Emitter and Receiver Models (Non-Cascadeable) with 14 mm Resolution

The standard 8-pin QD models are listed; 8-pin emitters/receivers feature “swapable” wiring. Order one 8-pin cable for each 8-pin emitter or receiver, or one 5-pin cable for each 5-pin emitter.

For cascadeable 14 mm emitter and receiver models, see [Cascadeable Emitter and Receiver Models with 14 mm Resolution](#) on p. 64.

Defined Area Height	Standard 14 mm Resolution Models 0.1 m to 6 m (4 in to 20 ft) range				
	Emitter (8-pin)	Receiver	Emitter/Receiver Pair	Number of Beams	Response Time (Tr)
150 mm (5.9 in)	SLSE14-150Q8	SLSR14-150Q8	SLSP14-150Q88	20	11 ms
300 mm (11.8 in)	SLSE14-300Q8	SLSR14-300Q8	SLSP14-300Q88	40	15 ms
450 mm (17.7 in)	SLSE14-450Q8	SLSR14-450Q8	SLSP14-450Q88	60	19 ms
600 mm (23.6 in)	SLSE14-600Q8	SLSR14-600Q8	SLSP14-600Q88	80	23 ms
750 mm (29.5 in)	SLSE14-750Q8	SLSR14-750Q8	SLSP14-750Q88	100	27 ms
900 mm (35.4 in)	SLSE14-900Q8	SLSR14-900Q8	SLSP14-900Q88	120	32 ms
1050 mm (41.3 in)	SLSE14-1050Q8	SLSR14-1050Q8	SLSP14-1050Q88	140	36 ms
1200 mm (47.2 in)	SLSE14-1200Q8	SLSR14-1200Q8	SLSP14-1200Q88	160	40 ms
1350 mm (53.1 in)	SLSE14-1350Q8	SLSR14-1350Q8	SLSP14-1350Q88	180	43 ms
1500 mm (59 in)	SLSE14-1500Q8	SLSR14-1500Q8	SLSP14-1500Q88	200	48 ms
1650 mm (65 in)	SLSE14-1650Q8	SLSR14-1650Q8	SLSP14-1650Q88	220	52 ms
1800 mm (70.9 in)	SLSE14-1800Q8	SLSR14-1800Q8	SLSP14-1800Q88	240	56 ms

To order the 5-pin emitters with the Test input, replace the suffix “Q8” with “Q5”, (e.g., SLSE14-150Q5), and for the pair replace “Q88” with “Q85” (e.g., SLSP14-150Q85).

To order the pigtail QD (8-pin only) model, replace the “Q” in the model number with “P” (e.g., SLSE14-150P8).

To order the ESD-safe models, add “N” to the model number, prior to the QD option designation (e.g., SLSE14-150NQ8). ESD-safe models are not available with the pigtail QD option.

To order optional housing finishes, add these letters in front of the QD designation in the model number,

- add “A” for a clear (brushed) anodized aluminum finish, black endcaps (e.g., SLSE14-150AQ8),
- add “S” for a nickel-plated (“silver”) finish, black endcaps (e.g., SLSE14-150SQ8),
- add “B” for a black painted finish, black endcaps (e.g., SLSE14-150BQ8),
- add “W” for a white painted finish, black endcaps (e.g., SLSE14-150WQ8), or
- add “SO” for a “safety orange” painted finish, black endcaps (e.g., SLSE14-150SOQ8).

4.3 Standard Emitter and Receiver Models (Non-Cascadeable) with 30 mm Resolution

The standard 8-pin QD models are listed; 8-pin emitters/receivers feature “swappable” wiring. Order one 8-pin cable for each 8-pin emitter or receiver, or one 5-pin cable for each 5-pin emitter.

For cascadeable 30 mm emitter and receiver models, see [Cascadeable Emitter and Receiver Models with 30 mm Resolution](#) on p. 65.

Defined Area Height	Standard 30 mm Resolution Models 0.1 m to 18 m (4 in to 60 ft) range				
	Emitter (8-pin)	Receiver	Emitter/Receiver Pair	Number of Beams	Response Time (Tr)
150 mm (5.9 in)	SLSE30-150Q8	SLSR30-150Q8	SLSP30-150Q88	10	9 ms
300 mm (11.8 in)	SLSE30-300Q8	SLSR30-300Q8	SLSP30-300Q88	20	11 ms
450 mm (17.7 in)	SLSE30-450Q8	SLSR30-450Q8	SLSP30-450Q88	30	13 ms
600 mm (23.6 in)	SLSE30-600Q8	SLSR30-600Q8	SLSP30-600Q88	40	15 ms
750 mm (29.5 in)	SLSE30-750Q8	SLSR30-750Q8	SLSP30-750Q88	50	17 ms
900 mm (35.4 in)	SLSE30-900Q8	SLSR30-900Q8	SLSP30-900Q88	60	19 ms
1050 mm (41.3 in)	SLSE30-1050Q8	SLSR30-1050Q8	SLSP30-1050Q88	70	21 ms
1200 mm (47.2 in)	SLSE30-1200Q8	SLSR30-1200Q8	SLSP30-1200Q88	80	23 ms
1350 mm (53.1 in)	SLSE30-1350Q8	SLSR30-1350Q8	SLSP30-1350Q88	90	25 ms

Defined Area Height	Standard 30 mm Resolution Models 0.1 m to 18 m (4 in to 60 ft) range				
	Emitter (8-pin)	Receiver	Emitter/Receiver Pair	Number of Beams	Response Time (Tr)
1500 mm (59 in)	SLSE30-1500Q8	SLSR30-1500Q8	SLSP30-1500Q88	100	27 ms
1650 mm (65 in)	SLSE30-1650Q8	SLSR30-1650Q8	SLSP30-1650Q88	110	30 ms
1800 mm (70.9 in)	SLSE30-1800Q8	SLSR30-1800Q8	SLSP30-1800Q88	120	32 ms
1950 mm (76.8 in)	SLSE30-1950Q8	SLSR30-1950Q8	SLSP30-1950Q88	130	34 ms
2100 mm (82.7 in)	SLSE30-2100Q8	SLSR30-2100Q8	SLSP30-2100Q88	140	36 ms
2250 mm (88.6 in)	SLSE30-2250Q8	SLSR30-2250Q8	SLSP30-2250Q88	150	38 ms
2400 mm (94.5 in)	SLSE30-2400Q8	SLSR30-2400Q8	SLSP30-2400Q88	160	40 ms

To order the 5-pin emitters with the Test input, replace the suffix “Q8” with “Q5”, (e.g., SLSE30-150Q5), and for the pair replace “Q88” with “Q85” (e.g., SLSP30-150Q85).

To order the pigtail QD (8-pin only) model, replace the “Q” in the model number with “P” (e.g., SLSE30-150P8).

To order the ESD-safe models, add “N” to the model number, prior to the QD option designation (e.g., SLSE30-150NQ8). ESD-safe models are not available with the pigtail QD option.

To order optional housing finishes, add these letters in front of the QD designation in the model number,

- add “A” for a clear (brushed) anodized aluminum finish, black endcaps (e.g., SLSE30-150AQ8),
- add “S” for a nickel-plated (“silver”) finish, black endcaps (e.g., SLSE30-150SQ8),
- add “B” for a black painted finish, black endcaps (e.g., SLSE30-150BQ8),
- add “W” for a white painted finish, black endcaps (e.g., SLSE30-150WQ8), or
- add “SO” for a “safety orange” painted finish, black endcaps (e.g., SLSE30-150SOQ8).

4.4 Cordsets

Machine interface cordsets provide power to the first emitter/receiver pair. Sensor interconnect cables provide power to subsequent emitters and receivers in the cascade.

4.4.1 Single-Ended (Machine Interface) Cordsets (One Cable for Each Emitter and Receiver)

Overmold and cordsets are PVC-jacketed. Cordsets are unterminated on one end to interface with the guarded machine.

For 8-pin Emitters and Receivers

8-Pin Threaded M12/Euro-Style Cordsets				
Model	Length	Style	Dimensions	Pinout (Female)
QDE-815D	4.57 m (15 ft)	Straight		
QDE-825D	7.62 m (25 ft)			
QDE-850D	15.2 m (50 ft)			
QDE-875D	22.9 m (75 ft)			
QDE-8100D	30.5 m (100 ft)			

For 8-pin Emitters and Receivers					
8-pin Systems require two 8-pin QD cables. Only pins 1, 6, and 7 are connected on 8-pin emitters. The European M12 Specification pin assignment and color codes are listed as a customer courtesy. The user must verify suitability of these cables for each application.					
Banner Cable Pinout/Color Code			European M12 Specification		
Pin	Color	Function	Pin	Color	Function
1	Brown	+ 24 V dc	1	White	+ 24 V dc
2	Orange/Black	EDM #2 (Aux)	2	Brown	EDM #2 (Aux)
3	Orange	EDM #1	3	Green	EDM #1
4	White	OSSD #2	4	Yellow	OSSD #2
5	Black	OSSD #1	5	Gray	OSSD #1
6	Blue	0 V dc	6	Pink	0 V dc
7	Green/Yellow	Gnd/Chassis	7	Blue	Ground/Chassis
8	Violet	Reset	8	Red	Reset

5-Pin Threaded M12/Euro-Style Cordsets with Green/Yellow Ground Wire—Single Ended				
Model	Length	Style	Dimensions	Pinout (Female)
QDE-515D	4.57 m (15 ft)	Straight		 <p>1 = Brown 2 = White 3 = Blue 4 = Black 5 = Green/Yellow</p>
QDE-525D	7.62 m (25 ft)			
QDE-550D	15.2 m (50 ft)			
QDE-575D	22.9 m (75 ft)			
QDE-5100D	30.5 m (100 ft)			

For 5-pin Emitters and Receivers					
5-pin EZ-SCREEN emitter, model numbers SLSE...Q5 with Test function. One 5-pin and one 8-pin QD cable required for complete system. The European M12 Specification pin assignment and color codes are listed as a customer courtesy. The user must verify suitability of these cables for each application.					
Banner Cable Pinout/Color Code			European M12 Specification		
Pin	Color	Function	Pin	Color	Function
1	Brown	+ 24 V dc	1	Brown	+ 24 V dc
2	White	Test #2	2	White	Test #2
3	Blue	0 V dc	3	Blue	0 V dc
4	Black	Test #1	4	Black	Test #1
5	Green/Yellow	Gnd/Chassis	5	Shield	Gnd/Chassis

4.4.2 Double-Ended (Sensor Interconnect) Cordsets

Double-ended cables are generally used to interconnect multiple emitters (8-pin or 5-pin) or receivers (8-pin) within a cascaded system. They are also useful for extending either the branch or trunk cables of a model CSB splitter cordset. When combining cables in a multiple-light-screen cascade, refer to [Determining Interconnect Cable Lengths](#) on p. 66 for maximum cable lengths.

8-Pin Threaded M12/Euro-Style Cordsets—Double Ended				
Model (8-pin/8-pin) ³	Length	Style	Dimensions	Pinout
DEE2R-81D	0.31 m (1 ft)	Female Straight/ Male Straight		Female 
DEE2R-83D	0.91 m (3 ft)			Male 
DEE2R-88D	2.44 m (8 ft)			1 = White 2 = Brown 3 = Green 4 = Yellow
DEE2R-815D	4.57 m (15 ft)			5 = Gray 6 = Pink 7 = Blue 8 = Red
DEE2R-825D	7.62 m (25 ft)			
DEE2R-850D	15.2 m (50 ft)			
DEE2R-875D	22.9 m (75 ft)			
DEE2R-8100D	30.5 m (100 ft)			

5-Pin Threaded M12/Euro-Style Cordsets—Double Ended				
Model	Length	Style	Dimensions	Pinout
DEE2R-51D	0.31 m (1 ft)	Female Straight/ Male Straight		Male 
DEE2R-53D	0.91 m (3 ft)			Female 
DEE2R-58D	2.44 m (8 ft)			1 = Brown 2 = White 3 = Blue 4 = Black 5 = Green/Yellow
DEE2R-515D	4.57 m (15 ft)			
DEE2R-525D	7.62 m (25 ft)			
DEE2R-550D	15.2 m (50 ft)			
DEE2R-575D	22.9 m (75 ft)			
DEE2R-5100D	30.5 m (100 ft)			

4.4.3 Splitter Cordsets

Model CSB splitter cordsets allow easy interconnection between an EZ-SCREEN 8-pin receiver and its 8-pin emitter, providing a single “homerun” cable for the optional “swapable” wiring. The model DEE2R-.. double-ended cables may be used to extend the lengths of the QD trunk, branch #1, or branch #2. (Branch #1 and branch #2 cable sections are 300 mm/1 ft long.) The model QDE-8..D single-ended cables may be used to extend the QD trunk for cut-to-length applications.

³ Standard cordsets are yellow PVC with black overmold. For black PVC and overmold, add suffix "B" to model number (example, DEE2R-81DB)

8-Pin Threaded M12/Euro-Style Splitter Cordsets—Flat Junction			
Model	Trunk (Male)	Branches (Female)	Pinout
CSB-M1280M1280	No trunk	No branches	<p>Male</p>  <p>Female</p>  <p>1 = Brown 2 = Or/Bk 3 = Orange 4 = White 5 = Black 6 = Blue 7 = Gn/Ye 8 = Violet</p>
CSB-M1281M1281	0.3 m (1 ft)	2 x 0.3 m (1 ft)	
CSB-M1288M1281	2.44 m (8 ft)		
CSB-M12815M1281	4.57 m (15 ft)		
CSB-M12825M1281	7.62 m (25 ft)		
CSB-UNT825M1281	7.62 m (25 ft) Unterminated		
			

4.4.4 Bulkhead Connector

Connector for panel connection of EZ-SCREEN component cables.

Model	Connection	Dimensions
PMEF-810D	8-pin Euro-style female connector 3 m (10 ft) wires, cut to length (Banner color code); 22 AWG/0.33 mm ²	

4.5 Documentation

The following documentation is supplied with each EZ-SCREEN receiver. Additional copies are available at no charge.

Part Number	Description
112852	EZ-SCREEN 14/30mm System Instruction Manual
113361	Checkout Procedure Card (Daily) – Stand-Alone Systems
118173	Checkout Procedure Card (Daily) – Cascaded Systems
113362	Checkout Procedure Card (Semi-Annual)
114189	Diagnostic Display Label

5 Installation Instructions

5.1 Installation and Alignment

Before installing the EZ-SCREEN 14/30mm Safety Light Curtain, read [Appropriate Applications and Limitations](#) on p. 9 and the installation instructions of the EZ-SCREEN 14/30mm manual (p/n 112852) in their entirety. The System's ability to perform its safety guarding function depends upon the appropriateness of the application and upon its proper mechanical and electrical installation and interfacing to the guarded machine. If all mounting, installation, interfacing, and checkout procedures are not followed properly, the System cannot provide the protection for which it was designed. Installation must be performed by a Qualified Person, as defined in [Security Protocol](#) on p. 50.

Note:

- **Read this Section Carefully Before Installing the System**
- **Failure to follow these instructions could result in serious injury or death.**
- If all mounting, installation, interfacing, and checkout procedures are not followed properly, the Banner device cannot provide the protection for which it was designed.
- The user is responsible for ensuring that all local, state, and national laws, rules, codes, or regulations relating to the installation and use of this control system in any particular application are satisfied. Ensure that all legal requirements have been met and that all technical installation and maintenance instructions contained in this manual are followed.
- The user has the sole responsibility to ensure that this Banner device is installed and interfaced to the guarded machine by Qualified Persons, in accordance with this manual and applicable safety regulations. A Qualified person is a person who, by possession of a recognized degree or certificate of professional training, or who, by extensive knowledge, training and experience, has successfully demonstrated the ability to solve problems relating to the subject matter and work.

5.2 Mechanical Installation Considerations

The two primary factors that influence the layout of the EZ-SCREEN system mechanical installation are the Safety Distance (Minimum Distance) and the supplemental safeguarding/eliminating pass-through hazards. Other considerations include:

- Emitter and Receiver Orientation (see [Emitter and Receiver Orientation](#) on p. 26)
- Adjacent Reflective Surfaces (see [Adjacent Reflective Surfaces](#) on p. 27)
- Use of Corner Mirrors (see [Use of Corner Mirrors](#) on p. 28)
- Installation of Multiple Systems (see [Installation of Multiple Systems](#) on p. 29)

WARNING:

- **Position the System Components Carefully**
- Failure to observe this warning could result in serious injury or death.
- Position the system components such that the hazard cannot be accessed by reaching over, under, around, or through the sensing field. Additional and supplemental guarding may be required.

5.2.1 Calculating the Safety Distance (Minimum Distance)

Safety Distance (Ds), also called Minimum Distance (S), is the minimum distance required between the defined area and the closest reachable hazard point. The distance is calculated so that when an object or a person is detected (by blocking a sensing beam), the EZ-SCREEN sends a stop signal to the machine, causing it to stop by the time the object or person can reach any machine hazard point.

The distance is calculated differently for U.S. and European installations. Both methods take into account several factors, including a calculated human speed, the total system stopping time (which itself has several components), and the depth penetration factor. After the distance has been determined, record the calculated distance on the Daily Checkout Card.

WARNING:

- **Calculate the Safety Distance (Minimum Distance)**
- Failure to establish and maintain the safety distance (minimum distance) could result in serious injury or death.
- Mount the components at a distance from the nearest hazard such that an individual cannot reach the hazard before cessation of the hazardous motion or situation. Calculate this distance using the supplied formulas, as described by ANSI B11.19 and ISO 13855. Mount the components more than 100 mm (4 in) away from the hazard, regardless of the calculated value.

WARNING: Reduced Resolutions increases Dpf (or C). Increase the depth penetration factor to calculate proper minimum distance when using a Reduced Resolution configuration. Always turn Reduced Resolution mode off when the larger minimum object size is not required.

Figure 3. Safety distance (minimum distance) and hard (fixed) guarding

Formula and Examples

U.S. Applications

The Safety (Separation) Distance formula for U.S. applications:

$$D_s = K \times (T_s + T_r) + D_{pf}$$

European Applications

The Minimum Distance formula for European applications:

$$S = (K \times T) + C$$

U.S. Applications	European Applications
<p>Ds the Safety Distance, in inches</p> <p>K 1600 mm per second (or 63 in per second), the OSHA 29CFR1910.217, and ANSI B11.19 recommended hand-speed constant (see Note 1 below)</p> <p>Ts the overall stop time of the machine (in seconds) from the initial stop signal to the final ceasing of all motion, including stop times of all relevant control elements (for example, IM-T-... Interface Modules) and measured at maximum machine velocity (see Note 3 below)</p> <p>Tr the maximum response time, in seconds, of the EZ-SCREEN emitter/receiver pair (depending on model)</p> <p>Dpf the added distance due to the depth penetration factor as prescribed in OSHA 29CFR1910.217, and ANSI B11.19 for U.S. applications. See Depth Penetration Factor (Dpf) table below or calculate using the formula (in mm): $Dpf = 3.4 \times (S - 7)$ where S is the resolution of the light curtain (for $S \leq 63$ mm).</p>	<p>S the Minimum Distance, in mm, from danger zone to light screen center line; minimum allowable distance is 100 mm (175 mm for non-industrial applications), regardless of calculated value</p> <p>K hand-speed constant (see Note 2 below); 2000 mm/s (for Minimum Distances ≤ 500 mm) 1600 mm/s (for Minimum Distances > 500 mm)</p> <p>T the overall machine stopping response time (in seconds), from the physical initiation of the safety device and the machine coming to a stop (or the hazard removed). This can be broken down into two parts: Ts and Tr where T = Ts + Tr</p> <p>C the additional distance, in mm, based on intrusion of a hand or object towards the danger zone prior to actuation of a safety device. Calculate using the formula (in mm):</p> $C = 8 \times (d - 14)$ <p>where d is the resolution of the light curtain (for $d \leq 40$ mm).</p>

Table 1: Depth Penetration Factor (Dpf)

Reduced Resolution	Depth Penetration Factor (Dpf)	
	14 mm Systems	30 mm Systems
OFF	24 mm (1 in)	78 mm (3 in)
ON	78 mm (3 in)	180 mm (7 in)

Notes:

1. The OSHA-recommended hand speed constant **K** has been determined by various studies and, although these studies indicate speeds of 1600 mm/sec. (63 in/sec.) to more than 2500 mm/sec. (100 in/sec.), they are not conclusive determinations. Consider all factors, including the physical ability of the operator, when determining the value of **K** to be used.
2. The recommended hand speed constant **K**, derived from data on approach speeds of the body or parts of the body as stated in ISO 13855.
3. **Ts** is usually measured by a stop-time measuring device. If the machine manufacturer's specified stop time is used, at least 20% should be added to allow for possible clutch/ brake system deterioration. This measurement must take into account the slower of the two MPCE channels, and the response time of all devices or controls that react to stop the machine.

**WARNING:**

- **Stop time (Ts) must include the response time of all devices or controls that react to stop the machine**
- If all devices are not included, the calculated safety distance (Ds or S) will be too short, which can lead to serious injury or death.
- Include the stop time of all relevant devices and controls in your calculations.
- If required, each of the two machine primary control elements (MPCE1 and MPCE2) must be capable of immediately stopping the dangerous machine motion, regardless of the state of the other. These two channels of machine control need not be identical, but the stop time performance of the machine (Ts, used to calculate the safety distance) must take into account the slower of the two channels.

Examples

Example: U.S. Applications, Model

K	= 63 in. per second (the hand speed constant set by OSHA)
T_s	= 0.32 (0.250 second is specified by the machine manufacturer; plus 20% safety factor; plus 20 ms for interface module IM-T-9A response time)
T_r	= 0.023 seconds (the specified response time of an SLSP14-600 EZ-SCREEN)
D_{pf}	= 3 in

Our example uses a 600 mm system with 14 mm resolution and Reduced Resolution ON, so D_{pf} is 3 inches. Response time for this example is 0.023 seconds.

Substitute the numbers into the formula as follows:

$$D_s = K \times (T_s + T_r) + D_{pf}$$

$$D_s = 63 \times (0.32 + 0.023) + 3 = 24.6 \text{ in}$$

Mount the EZ-SCREEN emitter and receiver so that no part of the defined area will be closer than 24.6 in. to the closest reachable hazard point on the guarded machine.

Example: European Applications, Model

K	= 1600 mm per second
T	= 0.343 (0.250 second specified by machine manufacturer; plus 20% safety factor; plus 20 ms interface module response time), plus 0.023 seconds (the specified SLSP14-600 response time)
C	= 8 x (30 - 14) = 128 mm (14 mm resolution, Reduced Resolution ON)

Substitute the numbers into the formula as follows:

$$S = (K \times T) + C$$

$$S = (1600 \times 0.343) + 128 = 676.8 \text{ mm}$$

Mount the EZ-SCREEN emitter and receiver so that no part of the defined area will be closer than 676.8 mm to the closest reachable hazard point on the guarded machine.

5.2.2 Reducing or Eliminating Pass-Through Hazards

A *pass-through* hazard is associated with applications where personnel may pass through a safeguard, such as the EZ-SCREEN 14/30mm Safety Light Curtain (which issues a stop command to remove the hazard), and then continues into the guarded area. This is common in access and perimeter guarding applications. Subsequently, their presence is no longer detected, and the related danger becomes the unexpected start or restart of the machine while personnel are within the guarded area.

A pass-through hazard typically results from large safety distances calculated from long stopping times, large minimum object sensitivities, reach-over, reach-through, or other installation considerations. A pass-through hazard can be generated with as little as 75 mm (3 in) between the sensing field and the machine frame or hard (fixed) guarding.

Eliminate or reduce pass-through hazards whenever possible. While it is recommended to eliminate the pass-through hazard altogether, this may not be possible due to machine layout, machine capabilities, or other application considerations.

One solution is to ensure that personnel are continually sensed while within the hazardous area. This can be accomplished by using supplemental safeguarding, such as described by the safety requirements in ANSI B11.19 or other appropriate standards.

An alternative method is to ensure that once the safeguarding device is tripped it will latch and will require a deliberate manual action to reset. This method of safeguarding relies upon the location of the reset switch as well as safe work practices and procedures to prevent an unexpected start or restart of the guarded machine. The EZ-SCREEN 14/30mm Safety Light Curtain provides a configurable Manual Start/Restart (Latch Output) function for these applications.

WARNING:

- **Use of the Banner device for Access or Perimeter Guarding**
- Failure to observe this warning could result in serious injury or death.
- If a Banner device is installed in an application that results in a pass-through hazard (for example, perimeter guarding), either the Banner device or the Machine Primary Control Elements (MPCEs) of the guarded machine must cause a Latched response following an interruption of the defined area.
- The reset of this Latched condition may only be achieved by actuating a reset switch that is separate from the normal means of machine cycle initiation.

**WARNING:**

- **Perimeter guarding applications**
- Failure to observe this warning could result in serious injury or death.
- Use lockout/tagout procedures per ANSI Z244.1, or use additional safeguarding as described by ANSI B11.19 safety requirements or other applicable standards if a passthrough hazard cannot be eliminated or reduced to an acceptable level of risk.

5.2.3 Reset Switch Location

The reset switch must be mounted at a location that complies with the warning and guidelines below. If any hazardous areas are not in view from the switch location, additional means of safeguarding must be provided. The switch should be protected from accidental or unintended actuation (for example, through the use of rings or guards).

A key-actuated reset switch provides some operator or supervisory control, as the key can be removed from the switch and taken into the guarded area. However, this does not prevent unauthorized or inadvertent resets due to spare keys in the possession of others, or additional personnel entering the guarded area unnoticed. When considering where to locate the reset switch, follow the guidelines below.

**WARNING:**

- **Install reset switches properly**
- Failure to properly install reset switches could result in serious injury or death.
- Install reset switches so that they are accessible only from outside, and in full view of, the safeguarded space. Reset switches cannot be accessible from within the safeguarded space. Protect reset switches against unauthorized or inadvertent operation (for example, through the use of rings or guards). If there are any hazardous areas that are not visible from the reset switches, provide additional safeguarding.

All reset switches must be:

- Outside the guarded area
- Located to allow the switch operator a full, unobstructed, view of the entire guarded area while the reset is performed
- Out of reach from within the guarded area
- Protected against unauthorized or inadvertent operation (such as through the use of rings or guards).

Important: Resetting a safeguard must not initiate hazardous motion. Safe work procedures require a start-up procedure to be followed and the individual performing the reset to verify that the entire hazardous area is clear of all personnel before each reset of the safeguard is performed. If any area cannot be observed from the reset switch location, additional supplemental safeguarding must be used: at a minimum, visual and audible warnings of machine start-up.

5.2.4 Supplemental Safeguarding

Properly position the EZ-SCREEN such that an individual cannot reach through the defined area and access the hazard point before the machine has stopped.

Additionally, the hazard cannot be accessible by reaching around, under, or over the defined area. To accomplish this, supplemental guarding (mechanical barriers, such as screens or bars), as described by ANSI B11.19 safety requirements or other appropriate standards, must be installed. Access will then be possible only through the defined area of the EZ-SCREEN System or through other safeguarding that prevents access to the hazard (see [Figure 4](#) on p. 26).

The mechanical barriers used for this purpose are typically called "hard (fixed) guarding"; there must be no gaps between the hard (fixed) guarding and the defined area. Any openings in the hard (fixed) guarding must comply with the safe opening requirements of ANSI B11.19 or other appropriate standard.

Figure 4. An example of supplemental safeguarding

[Figure 4](#) on p. 26 shows an example of supplemental safeguarding inside a robotic work cell. The EZ-SCREEN, in conjunction with the hard (fixed) guarding, is the primary safeguard. Supplemental safeguarding (such as a horizontal-mounted safety light screen as an area guard) is required in areas that cannot be viewed from the reset switch (for example, behind the robot and the conveyor). Additional supplemental safeguarding may be required to prevent clearance or trapping hazards (for example, a safety mat as an area guard between the robot, the turntable, and the conveyor).

WARNING:

- **The hazard must be accessible only through the sensing field**
- Incorrect system installation could result in serious injury or death.
- The installation of the EZ-SCREEN must prevent any individual from reaching around, under, over or through the defined area and into the hazard without being detected.
- See OSHA CFR 1910.217, ANSI B11.19, and/or ISO 14119, ISO 14120 and ISO 13857 for information on determining safety distances and safe opening sizes for your guarding device. Mechanical barriers (for example, hard (fixed) guarding) or supplemental safeguarding might be required to comply with these requirements.

5.2.5 Emitter and Receiver Orientation

The emitter and receiver must be mounted parallel to each other and aligned in a common plane, with both machine interface cable ends pointing in the same direction. Never mount the emitter with its machine interface cable end oriented in the opposite direction of the cable end of the receiver. If this occurs, voids in the light screen may allow objects or personnel to pass through the defined area undetected.

The emitter and receiver may be oriented in a vertical or horizontal plane, or at any angle between horizontal and vertical, as long as they are parallel to each other and their cable ends point in the same direction. Verify that the light screen completely covers all access to the hazard point that is not already protected by hard (fixed) guarding or other supplemental guarding.

WARNING:

- **Properly install system components**
- Incorrectly orienting the system components impairs the performance of the system and results in incomplete guarding, which can result in serious injury or death.
- Install the system components with their corresponding cable ends pointing in the same direction.

Figure 5. Examples of Correct Emitter/Receiver Orientation

Figure 6. Examples of Incorrect Emitter/Receiver Orientation

5.2.6 Adjacent Reflective Surfaces

WARNING:

- **Do not install the system near reflective surfaces**
- Reflective surfaces could reflect the sensing beam(s) around an object or person within the defined area, preventing detection by the system. Failure to prevent reflection problems results in incomplete guarding and an optical short circuit that could result in serious injury or death.
- Do not locate the defined area near a reflective surface. Perform the trip test, as described in the product documentation, to detect such reflection(s).

A reflective surface located adjacent to the defined area may deflect one or more beams around an object in the defined area. In the worst case, an optical short circuit may occur, allowing an object to pass undetected through the defined area.

This reflective surface may result from shiny surfaces or glossy paint on the machine, the workpiece, the work surface, the floor, or the walls. Beams deflected by reflective surfaces are discovered by performing the trip test and the periodic checkout procedures. To eliminate problem reflections:

- If possible, relocate the sensors to move the beams away from the reflective surface(s), being careful to maintain adequate separation distance
- Otherwise, if possible, paint, mask, or roughen the shiny surface to reduce its reflectivity
- Where these are not possible (as with a shiny workpiece or machine frame), determine the worst-case resolution resulting from the optical short circuit and use the corresponding depth penetration factor (Dpf or C) in the Safety Distance (Minimum Distance) formula; or mount the sensors in such a way that the receiver's field of view and/or the emitter's spread of light are restricted from the reflective surface

- Repeat the trip test (see [Trip Test](#) on p. 38) to verify these changes have eliminated the problem reflection(s). If the workpiece is especially reflective and comes close to the defined area, perform the trip test with the workpiece in place

At installed operating range (R):
 $d = 0.0437 \times R$ (m or ft)

Operating range 0.1 to 3 m (4 in to 10 ft): $d = 0.13$ m (5 in)

Operating range > 3 m (>10 ft): $d = 0.0437 \times R$ (m or ft)

Figure 7. Adjacent Reflective Surfaces

5.2.7 Use of Corner Mirrors

EZ-SCREEN may be used with one or more corner mirrors. Mirrors are not allowed for applications that would allow undetected personnel access into the safeguarded area. The use of glass-surface corner mirrors reduces the maximum specified emitter/receiver separation by approximately 8 percent per mirror, as follows:

Light Screen Maximum Range					
Light Screen Series	0 Mirrors	1 Mirror	2 Mirrors	3 Mirrors	4 Mirrors
14 mm EZ-SCREEN® (SLS)	6 m (20 ft)	5.6 m (18.4 ft)	5.2 m (17.0 ft)	4.8 m (15.7 ft)	4.4 m (14.5 ft)
30 mm EZ-SCREEN® (SLS)	18 m (60 ft)	16.8 m (55 ft)	15.5 m (51 ft)	14.3 m (47 ft)	13.1 m (43 ft)
EZ-SCREEN® LP (SLP)	7 m (23 ft)	6.5 m (21.2 ft)	6.0 m (19.5 ft)	5.5 m (18.0 ft)	5.1 m (16.6 ft)
EZ-SCREEN® LP Basic (SLPVA)	4 m (13 ft)	3.7 m (12.1 ft)	3.4 m (11.2 ft)	3.1 m (10.3 ft)	2.8 m (9.2 ft)
EZ-SCREEN® LS (SLL)	12 m (39 ft)	11 m (36 ft)	10.1 m (33 ft)	9.3 m (30.5 ft)	8.6 m (28 ft)
EZ-SCREEN® LS Basic (SLLV)	8 m (26.2 ft)	7.4 m (24.3 ft)	6.8 m (22.3 ft)	6.2 m (20.3 ft)	5.7 m (18.7 ft)
EZ-SCREEN® Type 2 (LS2)	15 m (50 ft)	13.8 m (45 ft)	12.7 m (42 ft)	11.7 m (38 ft)	10.8 m (35 ft)

See the specific mirror data sheet or www.bannerengineering.com for more information.

If mirrors are used, the difference between the angle of incidence from the emitter to the mirror and from the mirror to the receiver must be between 45° and 120° (see [Figure 8](#) on p. 29). If placed at a sharper angle, an object in the light screen may deflect beam(s) to the receiver, preventing the object from being detected, also known as false proxing. Angles greater than 120° result in difficult alignment and possible optical short circuits.

WARNING:

- Retroreflective Mode Installation**
- Failure to follow these instructions may create unreliable sensing and may result in serious injury or death.
- Do not install emitters and receivers in retroreflective mode with less than a 45° angle of incidence. Install emitters and receivers at an appropriate angle.

Figure 8. Using EZ-SCREEN sensors in a retroreflective mode

5.2.8 Installation of Multiple Systems

Whenever two or more EZ-SCREEN emitter and receiver pairs are adjacent to one another, optical crosstalk may take place between the systems. To minimize optical crosstalk, alternate the positions of the emitters and receivers (see [Figure 9](#) on p. 30), or alternate Scan Codes.

When three or more systems are installed in the same plane (as shown in [Figure 9](#) on p. 30), optical crosstalk may occur between sensor pairs whose emitter and receiver lenses are oriented in the same direction. In this situation, eliminate optical crosstalk by mounting these sensor pairs exactly in line with each other within one plane, or by adding a mechanical barrier between the pairs.

To further aid in avoiding crosstalk, the sensors feature two selectable scan codes. A receiver set to one scan code will not respond to an emitter set to another code.

Figure 9. Installation of Multiple Systems

WARNING:

- **Properly connect multiple pairs of sensors**
- Connecting multiple output signal switching devices (OSSD) safety outputs to one interface module or otherwise parallel OSSD outputs can result in serious bodily injury or death, and is prohibited.
- Do not connect multiple pairs of sensors to a single device.

WARNING:

- **Use a scan code**
- If you do not use a scan code, a receiver can synchronize to the signal from the wrong emitter, reducing the safety function of the light screen and creating an unsafe condition that could result in serious injury or death.
- Configure adjacent systems to use different scan codes (for example, set one system to use scan code 1 and the other system to use scan code 2). Perform a trip test to confirm the light screen function.

5.3 Mounting the Emitter and Receiver

Emitter/receiver pairs with 14 mm (0.55 in) resolution may be spaced from 0.1 m to 6 m (4 in to 20 ft) apart. Emitter/receiver pairs with 30 mm (1.18 in) resolution may be spaced from 0.1 m to 18 m (4 in to 60 ft) apart. The maximum distance between an emitter and its receiver is reduced if corner mirrors are used (see [Use of Corner Mirrors](#) on p. 28). The supplied brackets allow $\pm 30^\circ$ rotation, when mounted to the sensor end caps.

From a common point of reference, ensuring the Safety Distance (Minimum Distance) calculated in [Calculating the Safety Distance \(Minimum Distance\)](#) on p. 21, make measurements to locate the emitter and receiver in the same plane, with their midpoints and display ends directly opposite each other.

Note: The connector ends of both sensors must point in the same direction (see [Emitter and Receiver Orientation](#) on p. 26).

Mount the emitter and receiver mounting brackets using the supplied M6 bolts and Keps nuts, or user-supplied hardware.

Mount the emitter and receiver in their brackets; position their windows directly facing each other. Measure from a reference plane (for example, a level building floor) to the same point(s) on the emitter and receiver to verify their mechanical alignment. Use a carpenter's level, a plumb bob, or the optional LAT-1 Laser Alignment Tool (see [Accessories](#) on p. 83), or check the diagonal distances between the sensors to achieve mechanical alignment. Final alignment procedures are explained in [Initial Checkout Procedure](#) on p. 34.

Center mounting brackets must be used with longer sensors if they are subject to shock or vibration. In such situations, the sensors are designed to be mounted with up to 900 mm (35.43 in) unsupported distance (between brackets). Sensors 1050 mm (45.33 in) and longer are supplied with a center bracket to be used as needed with the standard end-cap brackets.

1. Attach the center bracket to the mounting surface when mounting the end-cap brackets.
2. Attach the clamp to both slots of the housing, using the included M5 screws and T-nuts.
3. After the sensor is mounted to the end-cap brackets, attach the clamp to the center bracket using the supplied M5 screw.

Figure 10. Sensor Brackets

5.4 Sensor Mounting and Mechanical Alignment

Verify that:

- The emitter and receiver are directly opposite each other
- Nothing is interrupting the defined area
- The defined area is the same distance from a common reference plane for each sensor
- The emitter and receiver are in the same plane and are level/plumb and square to each other (vertical, horizontal, or inclined at the same angle, and not tilted front-to-back or side-to-side)

Figure 11. Incorrect Sensor Alignment

Angled or Horizontal Installations – verify that:

- Distance X at the emitter and receiver are equal
- Distance Y at the emitter and receiver are equal
- Distance Z at the emitter and receiver are equal from parallel surfaces
- Vertical face (the window) is level/plumb
- Defined area is square. Check diagonal measurements if possible; see Vertical Installations, on the right.

Vertical Installations – verify that:

- Distance X at the emitter and receiver are equal
- Both sensors are level/plumb (check both the side and face)
- Defined area is square. Check diagonal measurements if possible (Diagonal A = Diagonal B).

5.5 Mounting the Reset Switch

Mount the reset switch in a location that complies with the warning in [Reset Switch Location](#) on p. 25. See [Initial Electrical Connections](#) on p. 33 for electrical connection.

5.6 Routing Cordsets

Attach the required cordsets to the sensors, and route the sensor cables to the junction box, electrical panel, or other enclosure in which the interface module, the redundant mechanically linked interposing relays, FSDs, or other safety-related parts of the control system are located. This must be done per local wiring code for low-voltage dc control cables and may require installation of electrical conduit. See [Cordsets](#) on p. 17 for selection of Banner supplied cables.

EZ-SCREEN is designed and manufactured to be highly resistant to electrical noise and to operate reliably in industrial settings. However, extreme electrical noise may cause a random Trip or Latch condition; in extreme cases, a Lockout is possible.

Emitter and receiver wiring is low voltage; routing the sensor wires alongside power wires, motor/servo wires, or other high voltage wiring may inject noise into the EZ-SCREEN System. It is good wiring practice, and sometimes may be required by code, to isolate emitter and receiver cables from high-voltage wires, avoid routing cables close to “noisy” wiring, and provide a good connection to earth ground.

Sensor cabling and any interconnect wiring should have an insulation temperature rating of at least 90 °C (194 °F). In addition, QD cabling and any interconnect wires should meet the specifications in the following table:

Table 2: Maximum Machine Interface cable length versus total current draw (including both OSSD loads)

	0.5 A	0.75 A	1.0 A	1.25 A	1.5 A	1.75 A
18 AWG	114.3 m (375 ft)	76.2 m (250 ft)	57.3 m (188 ft)	45.1 m (148 ft)	38.1 m (125 ft)	33.2 m (109 ft)
20 AWG	73.1 m (240 ft)	48.8 m (160 ft)	36.6 m (120 ft)	30.0 m (95 ft)	24.4 m (80 ft)	21.3 m (70 ft)
22 AWG⁴	45.7 m (150 ft)	30.5 m (100 ft)	22.9 m (75 ft)	18.0 m (59 ft)	15.2 m (50 ft)	13.4 m (44 ft)

Note: Maximum cable lengths are intended to ensure that adequate power is available to the EZ-SCREEN System when the supply is operating at +24 V dc – 15%.

5.7 Initial Electrical Connections

WARNING:

- **Risk of electric shock**
- Failure to follow these instructions could result in serious injury or death.
- Disconnect or turn off power before installing, removing, or servicing the device.
- Install and connect the device in accordance with the National Electrical Code (NEC) and any applicable local code requirements and supply the device with an appropriate fuse box or circuit breaker (see *Specifications*).

Lockout/tagout procedures may be required (refer to OSHA1910.147, ANSI Z244-1, ISO 14118, or the appropriate standard for controlling hazardous energy). Following relevant electrical standards and wiring codes, such as the NEC, NFPA79 or IEC60204-1, always connect the earth ground (green/yellow wire). **Do not operate the EZ-SCREEN without an earth ground connection.**

Make the electrical connections in the order described in this section. Do not remove end-caps; no internal connections are to be made. All connections are made through the M12 Euro-style quick-disconnects.

When installing QD cables, do not use tools to tighten the coupling nut—hand-tighten only. **Do not rotate the body of the QD, or damage to the connector can occur.**

Emitter Cordset

EZ-SCREEN emitters have an 8-pin cordset, but not all conductors are used. The unused wires are in place to allow a parallel connection (color-for-color) to the receiver cable providing sensor interchangeability (or “swapability”); either sensor may be installed at either cordset connection. In addition to providing similar cabling, this wiring scheme is advantageous during installation, wiring, and troubleshooting.

Emitters with the optional TEST function (model number suffix Q5) use a 5-pin cable. Locate the black and the white wires at the cable end; if the Test input will be used, temporarily connect the ends of the wires to each other (but not to an external contact at this time). If the Test input will not be used, connect the emitter cable black and white wires together and properly terminate (for example, with the included wire-nut).

Receiver Cordset

Do not connect any wires to the machine control circuits (that is, OSSD outputs) at this time. For the initial power-up and checkout, normally open EDM must be configured. Locate the orange and orange/black wires (pins 2 and 3) and temporarily connect the ends of the wires to each other (but not to the machine at this time). Take precautions to prevent the wires from shorting to ground or to other sources of energy (for example, terminate with the included wire-nut). Final EDM wiring must be completed later.

If used, connect the external reset switch to the reset wire (violet) on the receiver cable and to 24 V dc (see [Generic Wiring Diagrams](#) on p. 45. See the warning in [Reset Switch Location](#) on p. 25 about the physical location of the reset switch. The reset switch must be a normally open switch that is held closed for approximately 1/4 second, but no longer than 2 seconds, and then re-opened to accomplish the reset. The switch must be capable of switching 10 V dc to 30 V dc at 30 mA.

5.7.1 Emitter Wiring Options

An EZ-SCREEN emitter with an 8-pin connector can be connected either to its own power supply or to the receiver cable, color-for-color. The color-for-color connection allows the emitter and receiver positions to be interchanged without rewiring.

An EZ-SCREEN emitter with an 5-pin connector and Test function is not capable of the color-for-color connection.

⁴ QDE-...D cables, see

5.8 Initial Checkout Procedure

The initial checkout procedure must be performed by a Qualified Person. It must be performed only after configuring the System and after connecting the components.

Perform this procedure to:

- Ensure proper installation when the System is first installed
- Ensure proper System function whenever any maintenance or modification is performed on the System or on the machinery that is guarded by the System.

5.8.1 Configuring the System for Initial Checkout

Verify the Test input is jumpered (if used) and the System is set to the factory defaults for initial checkout and optical alignment. (Factory defaults are for Trip Output, 2-Channel EDM, Reduced Resolution OFF, and Scan Code 1.)

For the initial checkout, the EZ-SCREEN System must be checked without power being available to the guarded machine. Final interface connections to the guarded machine cannot take place until the light screen system has been checked out. This may require lockout/tagout procedures (refer to OSHA1910.147, ANSI Z244-1, or the appropriate standard for controlling hazardous energy). These connections will be made after the initial checkout procedure has been successfully completed.

Verify:

- Power has been removed from (or is not available to) the guarded machine, its controls or actuators; and
- The machine control circuit or the Interface Module is not connected to the OSSD outputs at this time (permanent connections will be made later); and
- EDM is configured for No Monitoring (see [Machine Primary Control Elements and EDM Input](#) on p. 42).

5.8.2 Initial Power-Up

1. Inspect the area near the light screen for reflective surfaces, including work pieces and the guarded machine. Reflective surfaces may cause light beams to reflect around a person in the light screen, preventing the person from being detected and not stopping the machine motion (see [Adjacent Reflective Surfaces](#) on p. 27).
2. Eliminate the reflective surfaces as much as possible by relocating, painting, masking, or roughening them. Remaining problem reflections will become apparent during the trip test.
3. Verify that power is removed from the EZ-SCREEN System and from the guarded machine and that the OSSD safety outputs are not connected.
4. Remove all obstructions from the light screen.
5. Leaving power to the guarded machine off, make power and earth ground connections on both the emitter and receiver cables (see [Generic Wiring Diagrams](#) on p. 45).
6. Power up the EZ-SCREEN System only.
7. Verify that the input power is present to both the emitter and the receiver. At least one indicator on both the emitter and the receiver should be on and the start-up sequence should cycle.
8. Watch both the emitter and the receiver Status indicators and the receiver Zone indicators to determine the light screen alignment status.
 - **Lockout Condition** (emitter or receiver)—the Status indicator single-flashes red, and the receiver Zone and Reset indicators are off. Proceed to [Troubleshooting](#) on p. 78 for diagnostic information.
 - **Normal Operating Mode** (emitter)—The green Status indicator is on.
 - Test mode (5-pin emitters only): A flashing green System Status indicator (Test input open).
 - **Receiver Latch Condition, all optical beams clear**—the receiver red Status indicator is on and the amber Reset indicator is double-flashing; green Zone indicators are on. When the receiver is configured for Latch Output, the outputs are on only when all beams are clear and after a manual reset. If a reset routine can cause a Clear (Run) condition, optimize the alignment as described in the following section. If a Clear (Run) condition cannot be achieved, see “Blocked condition” below.
 - **Clear (Run) Condition** (receiver)—The green Status indicator is on (or flashing green if reduced resolution is enabled), and the amber Reset indicator is on. All green Zone indicators are on. To optimize alignment and maximize excess gain, slightly loosen the sensor mounting screws (x4) and rotate one sensor left and right, noting the positions where the Status indicators turn red (Blocked condition); repeat with the other sensor (see [Optical Alignment](#) on p. 35). Center each sensor between those two positions and tighten the end cap mounting screws, making sure to maintain the positioning as the screws are tightened. The sensor lenses must directly face each other. Proceed to [Trip Test](#) on p. 38 after optimum optical alignment is verified.

- **A Blocked Condition** (receiver)—The red Status indicator is on, the amber Reset indicator is on, one or more red Zone indicator(s) are on, identifying the location of the blocked beams, and the number of blocked beams is displayed. Proceed to [Optical Alignment](#) on p. 35.

Note: If beam 1 is blocked, Zone indicator 1 is red and all others are off. Beam 1 provides the synchronization signal.

Note: If the Test input is open, the 3-digit Diagnostic Display indicates the total number of beams in the system (minus one) and all Zone indicators are red.

5.8.3 Optical Alignment

WARNING:

- **Hazard exposure**
- Failure to follow these instructions could result in serious injury or death.
- Verify that no individuals are exposed to any hazard if the output signal switching device (OSSD) outputs turn on when the emitter and receiver become aligned.

1. Verify the sensor mounting (see [Mounting the Emitter and Receiver](#) on p. 31).
2. Verify the optimal alignment, adjusting the sensor rotation with the power on:
 - a. Verify that the emitter and the receiver are pointed squarely at each other. Use a straight edge (for example, a level) to determine the direction the sensor is facing. The sensor face must be perpendicular to the optical axis.

Note: At power-up, all indicators are tested (flash), then the Scan Code is displayed.

- b. Turn on the power to the emitter and the receiver. If Channel #1 beam is not aligned, the Status and Zone 1 indicators are red, and the Diagnostics Display indicates "CH1". Zone indicators 2–8 are off.

- c. If the green Status and amber Reset indicators are on, go to the next step. If not, rotate each sensor (one at a time) left and right until the green Status indicator is on. (As the sensor rotates out of alignment, the red Status indicator turns on). As more beams are aligned, the Zone indicators turn from red to green and the number of blocked beam indicators decreases.

Note: If the emitter Test input is open, the 7-segment Display indicates the total number of beams in the system (minus one) and all Zone indicators are red (except for 10-beam systems, where the Zone 1 indicator is green).

- d. To optimize the alignment, note the position where the red Status indicator turns on when the sensor is rotated both left and right. Center the sensor between the two positions, and tighten the end cap mounting screws, making sure the positioning does not drift as the screws are tightened. Repeat for the second sensor.

For situations where alignment is difficult, use a LAT-1-SS Laser Alignment Tool to assist or confirm alignment by providing a visible red dot along the sensor's optical axis.

Note: If at any time the red Status indicator begins to flash, the System has entered a Lockout condition. See [Troubleshooting](#) on p. 78 for more information.

5.8.4 Optical Alignment Procedure with Mirrors

EZ-SCREEN sensors may be used with one or more corner mirrors for guarding more than one side of an area. The MSM-... and SSM-... rear-surface glass mirrors are rated at 85% efficiency. Thus, excess gain and sensing range are reduced when using mirrors; see [Use of Corner Mirrors](#) on p. 28.

During any adjustments, allow only one individual to adjust any one item at any one time.

In addition to the standard optical alignment procedure, verify:

1. The emitter, receiver, and all mirrors are level and plumb.
2. The middle of the defined area and the center point of the mirrors are approximately the same distance from a common reference point, such as the same height above a level floor.
3. There are equal amounts of mirror surface above and below the defined area such that the optical beams are not passing below or above the mirror.

Note: A LAT-1-SS Laser Alignment Tool is very helpful by providing a visible red dot along the optical axis. See [Figure 12](#) on p. 37 and Banner Safety Applications Note SA104 (p/n [57477](#)) for more information.

Figure 12. Optical alignment using the LAT-1-SS

Figure 13. Corner Mirror Alignment

5.8.5 Reduced Resolution/Floating Blanking

Reduced Resolution increases the minimum diameter of an object that the light screen can reliably detect anywhere within its defined area. Reduced Resolution is generally used to allow one or more objects (usually workpiece materials) to move anywhere through the defined area, without tripping the OSSD safety outputs.

Enabling two-beam Reduced Resolution reduces the overall minimum object sensitivity, which allows multiple objects to move through the defined area. The effect is that any two consecutive beams (except for the sync beam) can be blocked, without causing the OSSDs to turn OFF. This is also called “Multiple-Point Floating Blanking.”

Multiple “holes” are created in which 14 mm systems detect a 30 mm object and ignore an 8.5 mm object. Similarly, 30 mm systems detect a 60 mm object and ignore a 17 mm object. See the DIP-switch configuration. During operation, the Status indicator flashes green when reduced resolution is enabled.

In reduced resolution applications, the separation distance always increases because of the larger depth penetration factor (Dpf). In either case, calculate the separation distance (see [Calculating the Safety Distance \(Minimum Distance\)](#) on p. 21).

Model	Reduced Resolution Setting	Maximum Size of Undetected Objects	Resulting Resolution
14 mm Resolution	Off	(Not applicable)	14 mm (0.55 in)
	On (2-beam)	8.5 mm (0.34 in)	30 mm (1.18 in)
30 mm Resolution	Off	(Not applicable)	30 mm (1.18 in)
	On (2-beam)	17 mm (0.67 in)	60 mm (2.36 in)

WARNING:

- Use reduced resolution and fixed blanking only when necessary
- Failure to follow these instructions could result in serious injury or death.
- Completely fill any holes created in the sensing field with the blanked object or increase the safety (minimum) distance to account for the larger resolution.

5.8.6 Fixed Blanking

Fixed blanking allows for a stationary object(s), such as tooling, to be ignored while it remains positioned within the defined area. A flashing green Zone indicator denotes the location of a blanked area. If the object is moved or removed, the System enters lockout mode so that an unexpected hole in the sensing field is not created.

One or multiple areas within an EZ-SCREEN sensor pair may be blanked out. The minimum number of beams between two blanked areas is one. Any beam other than the sync beam may be blanked. All beams of a fixed blanked area must stay blocked at all times (after the fixed blanking configuration mode has been exited), for the OSSDs to stay ON.

Configure Fixed Blanking

- From normal operation or a power off condition, move the second and third DIP switches (the first RR and T/L) both to the left (T and RR position).

Note: The fixed blanking process has a time limit of 10 minutes. If this time is exceeded, a lockout occurs and the process must be started over.

- Move the fourth and fifth DIP switches (the second RR and T/L) both to the right (L and OFF position). The first and sixth DIP switches are not part of this process. Do not move them to match this image.

- The receiver should now either be in a lockout condition or power is still off.
 - If power is off: Apply power
 - If the system is in a Lockout condition: Perform a valid reset sequence (close the reset switch for 0.25 to 2 seconds, then reopen the switch).

A fixed blanking configuration is indicated by:

- Display alternates between “PFA” and the number of blocked beams (“0” if all beams are clear). (PFA = Program Fixed Blanking Active)
- Zone indicators are active
- Amber/yellow Reset indicator is off
- Red Status indicator is on

- Position the object(s) to be blanked.
When the beams are blocked, the 7-segment display alternates between “PFA” and the number of blocked beams. The zone indicators remain active and denote the location of blocked beams.
- To teach the blanked beams, re-configure DIP switches for normal operation. Verify that only the objects to be blanked are interrupting the defined area. A lockout occurs if an object is moved or removed after teaching. The receiver indicates:
 - Display: PFC on (PFC = Program Fixed Blanking Complete)
 - Zone indicators flash the approximate location of fixed blanked area programmed
 - Reset indicator single-flashing amber/yellow
 - Status indicator single-flashing red
- Perform a valid reset sequence or cycle the power.
- To disable fixed blanking**, follow this same procedure, but remove all objects not to be blanked at step 4.

5.8.7 Trip Test

After optimizing the optical alignment, perform the trip test to verify the detection capability of the EZ-SCREEN System. This test will also verify correct sensor orientation and identify optical short circuits. Once the installation has passed the trip test, the safety outputs may be connected and the commissioning checkout may be performed (initial installations only).

Note: Cascaded systems—To test a cascaded system, each light screen must be tested individually, while monitoring the status indicator on the first receiver in the cascade.

Table 3: Appropriate Test Pieces for the Trip Test

Reduced Resolution	14 mm Resolution Models	30 mm Resolution Models
OFF	14 mm (0.55 in) dia. Model STP-13	30 mm (1.18 in) dia. Model STP-14
ON (2-beam)	30 mm (1.18 in) dia. Model STP-14	60 mm (2.36 in) dia. Model STP-15

1. Select the proper test piece supplied with the receiver.
2. Verify that the System is in Run mode, the green Status indicator is on, all Zone indicators are green, and the amber Status indicator is on.
3. Pass the specified test piece through the defined area in three paths: near the emitter, near the receiver, and midway between the emitter and receiver.

Figure 14. Trip Test

4. During each pass, while the test piece is interrupting the defined area, at least one Zone indicator **must be red. The red Zone indicator must change with the position of the test piece within the defined area.**
 - Trip Output Operation: The Status indicator must turn red and remain red for as long as the test piece remains in the defined area. If not, the installation has failed the trip test.
 - Latch Output Operation: The Status indicator must turn red and remain red. The amber Reset indicator must remain on. If the Reset indicator begins to flash at any time while the test piece is interrupting the defined area, the installation has failed the trip test.

If all Zone indicators turn green or fail to follow the position of the test piece while it is within the defined area, the installation has failed the trip test. Check for correct sensor orientation, reflective surfaces, and unguarded areas created due to the use of blanking. Do not continue until the situation is corrected.

When the test piece is removed from the defined area, in trip output operation, the Status indicator must be green (or flash green if Reduced Resolution is enabled.) In Latch Output Operation, the Status indicator remains red until a manual reset is performed (the amber Reset indicator flashes)..

WARNING:

- Trip test failure
- Using a system that has failed a trip test can result in serious bodily injury or death. If the trip test has failed, the system might not stop dangerous machine motion when a person or object enters the sensing field.
- Do not attempt to use the system if the system does not respond properly to the trip test.

5. If mirrors are used in the application: Test the defined area on each leg of the sensing path (for example, emitter to mirror, between mirror and receiver).

Figure 15. Trip Test with Corner Mirror

6. If the EZ-SCREEN System passes all checks during the trip test, go on to [Electrical Connections to the Guarded Machine](#) on p. 40.

5.9 Electrical Connections to the Guarded Machine

Verify that power has been removed from the EZ-SCREEN and the guarded machine. Make the permanent electrical connections as described in [OSSD Output Connections](#) on p. 40 and [FSD Interfacing Connections](#) on p. 41 as required by each individual application.

Lockout/tagout procedures may be required (refer to OSHA 1910.147, ANSI Z244-1, ISO 14118, or the appropriate standard for controlling hazardous energy). Follow relevant electrical standards and wiring codes, such as the NEC, NFPA79 or IEC 60204-1.

Supply power and external device monitoring (EDM) should already be connected. The EZ-SCREEN must also have been aligned and passed the Initial Checkout, as described in [Initial Checkout Procedure](#) on p. 34.

The final connections to be made or verified are:

- OSSD outputs (see [OSSD Output Connections](#) on p. 40)
- FSD interfacing (see [FSD Interfacing Connections](#) on p. 41)
- MPCE/EDM (see [Machine Primary Control Elements and EDM Input](#) on p. 42)
- Remote Test

WARNING:

- **Risk of electric shock**
- Use extreme caution to avoid electrical shock. Serious injury or death could result.
- Always disconnect power from the safety system (for example, device, module, interfacing, etc.), guarded machine, and/or the machine being controlled before making any connections or replacing any component. Lockout/tagout procedures might be required. Refer to OSHA 29CFR1910.147, ANSI Z244-1, or the applicable standard for controlling hazardous energy.
- Make no more connections to the device or system than are described in this manual. Electrical installation and wiring must be made by a Qualified Person⁵ and must comply with the applicable electrical standards and wiring codes, such as the NEC (National Electrical Code), ANSI NFPA79, or IEC 60204-1, and all applicable local standards and codes.

5.9.1 OSSD Output Connections

Both the Output Signal Switching Device (OSSD) outputs must be connected to the machine control so that the machine's safety-related control system interrupts the circuit or power to the Machine Primary Control Element(s) (MPCE), resulting in a non-hazardous condition.

Final Switching Devices (FSDs) typically accomplish this when the OSSDs go to an OFF state.

Refer to the output specifications in the Receiver Specifications and these warnings before making OSSD output connections and interfacing the EZ-SCREEN to the machine.

WARNING:

- **Interfacing both output signal switching devices (OSSD)**
- Failure to follow these instructions could result in serious injury or death.
- Unless the same degree of safety is maintained, never wire an intermediate device(s) (PLC, PES, PC) between the safety module outputs and the master stop control element it switches such that a failure causes a loss of the safety stop command or the failure allows the safety function to be suspended, overridden, or defeated.
- Connect both OSSD outputs to the machine control so that the machine's safety-related control system interrupts the circuit to the machine primary control element(s), resulting in a non-hazardous condition.

⁵ A person who, by possession of a recognized degree or certificate of professional training, or who, by extensive knowledge, training and experience, has successfully demonstrated the ability to solve problems relating to the subject matter and work.

**WARNING:**

- **OSSD Interfacing**
- Failure to properly interface the OSSD Outputs to the guarded machine could result in serious injury or death.
- To ensure proper operation, the Banner device output parameters and machine input parameters must be considered when interfacing the Banner device OSSD outputs to machine inputs. Design machine control circuitry so that all of the following are true:
 - The maximum load resistance value is not exceeded.
 - The maximum specified OSSD OFF-state voltage does not result in an ON condition.

5.9.2 FSD Interfacing Connections

FSDs (Final Switching Devices) take many forms. The most common are forced-guided devices, mechanically linked relays, or interface modules. The mechanical linkage between the contacts allows the device to be monitored by the External Device Monitoring circuit for certain failures.

Depending on the application, the use of FSDs can facilitate controlling voltage and current that differs from the OSSD outputs of the EZ-SCREEN. FSDs can also be used to control an additional number of hazards by creating multiple safety stop circuits.

Protective Stop (Safety Stop) Circuits

A protective stop (safety stop) allows for an orderly cessation of motion for safeguarding purposes, which results in a stop of motion and removal of power from the MPCEs (assuming this does not create additional hazards). A protective stop circuit typically comprises a minimum of two normally open contacts from forced-guided, mechanically linked relays, which are monitored through External Device Monitoring to detect certain failures in order to prevent the loss of the safety function. Such a circuit can be described as a "safe switching point". Typically, protective stop circuits are either single-channel, which is a series connection of at least two normally open contacts; or dual-channel, which is a separate connection of two normally open contacts. In either method, the safety function relies on the use of redundant contacts to control a single hazard. If one contact fails On, the second contact arrests the hazards and prevents the next cycle from occurring. See [Generic Wiring Diagrams](#) on p. 45.

The interfacing of the protective stop circuits must be accomplished so that the safety function cannot be suspended, overridden, or defeated, unless accomplished in a manner of the same or greater degree of safety as the machine's safety related control system that includes the EZ-SCREEN.

The normally open safety outputs from an interface module provide a series connection of redundant contacts that form protective stop circuits for use in either single-channel or dual-channel control. See [Generic Wiring Diagrams](#) on p. 45.

Dual-Channel Control

Dual-channel control provides the ability to electrically extend the safe switching point beyond the FSD contacts. With proper monitoring, this method of interfacing is capable of detecting certain failures in the control wiring between the safety stop circuit and the MPCEs. These failures include a short-circuit of one channel to a secondary source of energy or voltage, or a loss of the switching ability of one of the FSD outputs. Such failures may lead to a loss of redundancy, or to a complete loss of safety, if not detected and corrected.

The possibility of a failure to the wiring increases as the physical distance between the FSD safety stop circuits and the MPCEs increases, as the length or the routing of the interconnecting wires increases, or if the FSD safety stop circuits and the MPCEs are located in different enclosures. For this reason, dual-channel control with EDM monitoring should be used in any installation where the FSDs are located remotely from the MPCEs.

Single-Channel Control

Single-channel control uses a series connection of FSD contacts to form a safe switching point. After this point in the machine's safety-related control system, failures can occur that would result in a loss of the safety function (such as a short-circuit to a secondary source of energy or voltage). For this reason, single-channel control interfacing should be used only in installations where FSD safety stop circuits and the MPCEs are mounted within the same control panel, adjacent to each other, and are directly connected to each other; or where the possibility of such a failure can be excluded. If this cannot be achieved, then dual-channel control should be used.

Methods to exclude the possibility of these failures include, but are not limited to:

- Physically separating interconnecting control wires from each other and from secondary sources of power
- Routing interconnecting control wires in separate conduit, runs, or channels
- Locating all elements (modules, switches, and devices under control) within one control panel, adjacent to each other, and directly connected with short wires

- Properly installing multi-conductor cabling and multiple wires through strain relief fittings. Over-tightening of a strain-relief can cause short-circuits at that point.
- Using positive-opening or direct-drive components, installed and mounted in a positive mode

5.9.3 Machine Primary Control Elements and EDM Input

A machine primary control element (MPCE) is an electrically powered element that directly controls the normal operation of a machine in such a way that it is the last element (in time) to function when machine operation is to be initiated or arrested (per IEC 61496-1). Examples include motor contactors, clutch/brakes, valves, and solenoids.

Depending on the level of risk of harm, it may be required to provide redundant MPCEs or other control devices that are capable of immediately stopping the dangerous machine motion, irrespective of the state of the other. These two channels of machine control need not be identical (i.e., diverse redundant), but the stop time performance of the machine (Ts, used to calculate the separation distance, see [Calculating the Safety Distance \(Minimum Distance\)](#) on p. 21) must take into account the slower of the two channels. Refer to [Generic Wiring Diagrams](#) on p. 45 or consult the machine manufacturer for additional information.

To ensure an accumulation of failures does not compromise the redundant control scheme (cause a failure to danger), a method to verify the normal functioning of MPCEs or other control devices is required. EZ-SCREEN provides a convenient method for this verification: external device monitoring (EDM).

For the EZ-SCREEN external device monitoring to function properly, each device must include a normally closed, forced-guided (mechanically linked) contact that can accurately reflect the status of the device. This ensures that the normally open contacts, used for controlling hazardous motion, have a positive relationship with the normally closed monitoring contacts and can detect a failure to danger (for example, contacts that are welded closed or stuck On).

It is strongly recommended that a normally closed, forced-guided monitoring contact of each FSD and MPCE be connected to the EDM input (see [Generic Wiring Diagrams](#) on p. 45). If this is done, proper operation will be verified. Monitoring FSD and MPCE contacts is one method of maintaining control reliability (OSHA/ANSI) and Category 3 and 4 (ISO 13849-1).

If monitoring contacts are not available or do not meet the design requirement of being forced-guided (mechanically linked), it is recommended that you:

- Replace the devices so that they are capable of being monitored; or
- Incorporate the EDM function into the circuit as close to the MPCE as possible (for example, monitor the FSDs); and
- Employ the use of well-tries, tested, and robust components, and generally accepted safety principles, including fault exclusion, into the design and installation to either eliminate, or reduce to an acceptable (minimal) level of risk, the possibility of undetected faults or failures that can result in the loss of the safety function.

The principle of fault exclusion allows the designer to design out the possibility of various failures and justify it through the risk assessment process to meet the required level of safety performance, such as the requirements of Category 2, 3, or 4. See ISO 13849-1/-2 for further information.

WARNING:

- **External Device Monitoring (EDM)**
- Creating a hazardous situation could result in serious injury or death.
- If the system is configured for “no monitoring,” it is the user’s responsibility to ensure this does not create a hazardous situation.

External Device Monitoring

EZ-SCREEN provides three possible EDM configurations: 1-channel monitoring, 2-channel monitoring, and no monitoring. Their functions are described below.

The most common form of EDM is 1-channel monitoring; its primary advantages are simplicity of wiring and the ability to use the Auxiliary output. The installation must prevent short circuits across the N.C. monitoring contacts and to secondary sources of power.

Two-channel monitoring has the ability to detect additional failures, such as short circuits, and should be used when those failures can not be designed out or reasonably be excluded. Two-channel monitoring is also the default setting and has the advantage on additional diagnostic capability that can identify which specific element has slowed or failed.

External Device Monitoring Wiring

If not connected previously, it is again strongly recommended that one normally closed, forced-guided monitoring contact of each FSD and MPCE be wired as shown in the monitoring circuit (see [Generic Wiring Diagrams](#) on p. 45. Pins 2 and 3 of the receiver connector provide connection for the external device monitoring input. External device monitoring (EDM) must be wired in one of three configurations described below and this wiring configuration must agree with the receiver’s EDM DIP switch settings (see [System Configuration Settings](#) on p. 50).

One-Channel Monitoring: This is a series connection of closed monitor contacts that are forced-guided (mechanically linked) from each device controlled by the EZ-SCREEN. The monitor contacts must be closed before the EZ-SCREEN can be reset and the OSSDs can turn ON. After a reset is executed and the safety outputs (OSSDs) turn ON, the status of the monitor contacts are no longer monitored and may change state. However, the monitor contacts must be closed within 250 milliseconds of the OSSD outputs going from ON to OFF. Refer to [Generic Wiring Diagrams](#) on p. 45. Connect the monitor contacts between +24 V dc and EDM (orange wire, pin 9).

For EZ-SCREEN receivers with a date code prior to 0834, the monitoring contacts must open within 200 milliseconds of the OSSD outputs turning ON (a clear condition) and must close within 200 milliseconds of the OSSD outputs turning OFF (a blocked condition) or a lockout will occur.

Two-Channel Monitoring: This is an independent connection of closed monitor contacts that are forced-guided (mechanically linked) from each device controlled by the EZ-SCREEN. The monitor contacts must be closed before the EZ-SCREEN can be reset and the OSSDs can turn ON. Regardless of the state of the OSSDs, the monitor contacts may change state (either both open, or both closed). If the monitor contacts remain in opposite states for more than 250 milliseconds, a lockout occurs.

Figure 16. 2-Channel EDM Wiring

Refer to the figures above for 2-channel EDM wiring. Connect the monitor contacts as shown between +24 V dc and EDM1 (pin 3) and between +24 V dc and EDM2 (pin 2).

For EZ-SCREEN receivers with a date code prior to 0834, the monitoring contacts must always close within 200 milliseconds of the corresponding OSSD state change (turning OFF) or a lockout will occur.

No Monitoring: Use this configuration to perform the initial checkout; see [Initial Checkout Procedure](#) on p. 34. *If the application does not require the EDM function, it is the user's responsibility to ensure that this configuration does not create a hazardous situation.* To configure the System for No monitoring, jumper EDM1 (orange wire, pin 3) to EDM2 (orange/black wire, pin 2).

Refer to [Figure 21](#) on p. 47 for “no monitoring” wiring. Set the configuration DIP switch to E2, per [System Configuration Settings](#) on p. 50.

An alternate method to configure no monitoring is to set the configuration DIP switch to E1 (1-channel monitoring), per [System Configuration Settings](#) on p. 50, and connect EDM1 (orange wire, pin 3) to +24 V dc. This method allows the ability to use the auxiliary output (see [Auxiliary \(Aux.\) Output](#) on p. 43) in applications that do not require the EDM function.

5.10 Auxiliary (Aux.) Output

An aux. output function is available when the receiver is configured for 1-channel EDM (for receivers with date code 0834 or newer). This current sourcing (PNP) solid-state output (75 mA maximum) is used for control functions that are not safety related. A typical use is to signal the state of the OSSDs to a programmable logic controller (PLC). The aux. output follows the state of the OSSDs. Pin 2 (orange/black) supplies the connection; see [Generic Wiring Diagrams](#) on p. 45.

To use the auxiliary output in an application configured for no monitoring:

1. Set the configuration DIP switch to E1 (1-channel monitoring) per [System Configuration Settings](#) on p. 50.
2. Connect EDM1 (pin 3) to +24 V dc (see [Machine Primary Control Elements and EDM Input](#) on p. 42).

There are no compatibility issues retrofitting receivers with aux output into earlier installations, if precautions are taken to prevent EDM2 (pin 2, orange/black wire) from shorting to ground or another source of energy.

5.11 Remote Test Input

The 5-pin EZ-SCREEN emitter models (model numbers SLSE...Q5) provide a Test function. A pair of wires is connected from the emitter to an external switch, typically a normally open contact, held closed. Opening the switch “turns off” the emitter, simulating an interruption of one or more light beams; all OSSD outputs will turn OFF.

This remote test input function may be useful for EZ-SCREEN setup and to verify machine control circuit operation. See [Specifications](#) on p. 11, [Electrical Connections to the Guarded Machine](#) on p. 40, and [Sensor "Swapability"](#) on p. 44 for more information.

5.12 Preparing for System Operation

After the initial trip test has been accomplished, and the OSSD safety outputs and EDM connections have been made to the machine to be controlled, the EZ-SCREEN is ready for testing in combination with the guarded machine.

The operation of the EZ-SCREEN with the guarded machine must be verified before the combined System and machine may be put into service. To do this, a Qualified Person must perform the Commissioning Checkout Procedure.

5.13 Sensor "Swapability"

This wiring option provides sensor interchangeability (or “swapability”)—the ability to install either sensor at either QD connection.

To wire the emitter, use only three conductors (Brown = +24 V dc, Blue = 0 V dc, and Green/Yellow = GND). Connect the remaining wires in a parallel connection (color-for-color) to the receiver cable. The resulting installation provides the ability to swap the emitter and receiver position. This wiring option provides advantages during installation, wiring, and troubleshooting.

Figure 17. 8-pin connectors (optional wiring)

Model CSB.. splitter cordsets and DEE2R.. double-ended cables allow easy interconnection between an EZ-SCREEN receiver and emitter, providing a single trunk cable for the optional "swapable" wiring (see [Routing Cordsets](#) on p. 32).

5.14 Generic Wiring Diagrams

Emitter (Standard)

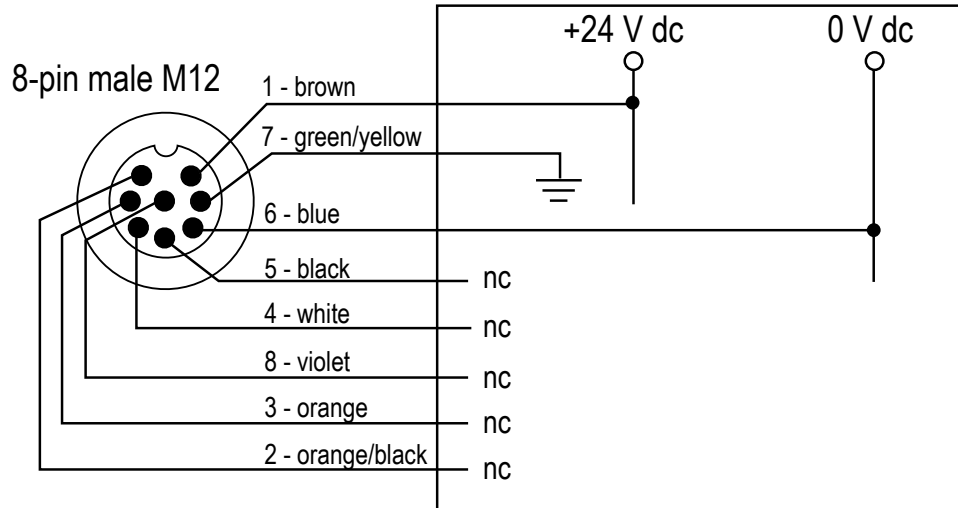

Figure 18. Emitter (Standard)—Generic Wiring

Note: *Pins 2, 3, 4, 5, and 8 are not connected or are connected in parallel to the same color wire from the receiver cable.

Emitter (with Test)

Figure 19. Emitter (with Test)—Generic Wiring

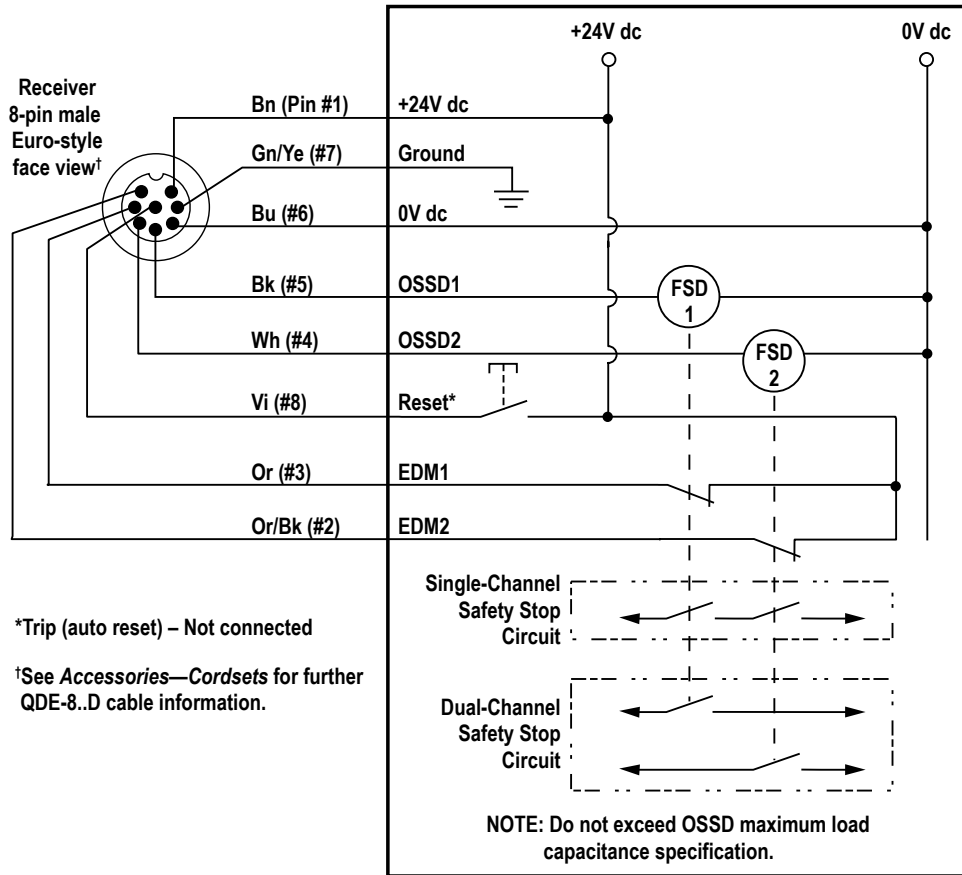

Figure 20. FSDs (2-channel EDM, with reset)—Generic Receiver Wiring

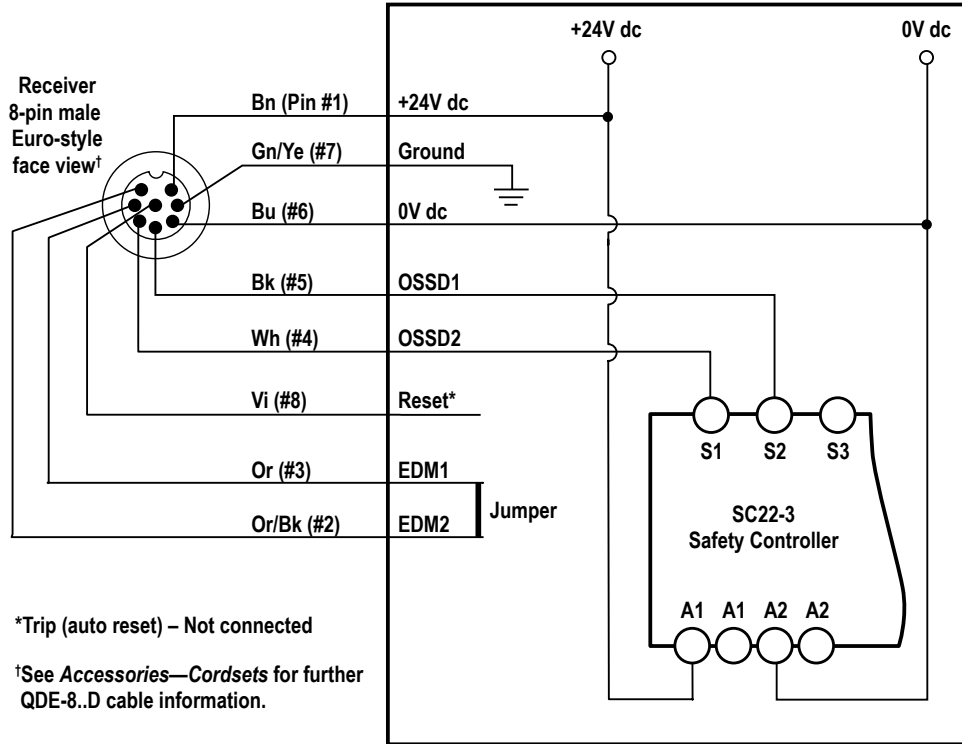

Figure 21. Self-checking Safety Module, Safety Controller, Safety PLC (no monitoring, no reset)—Generic Receiver Wiring

Note: DEE8-..D Adapter Cordsets can be used in a similar manner as the QDE-8..D.

EZ-SCREEN receiver DIP switches are configured for “Trip” (T) output and 2-channel EDM (E2). If the Auxiliary output is to be used, configure the EZ-SCREEN receiver for 1-channel EDM (E1) and connect pin #3 (Or) to +24 V dc.

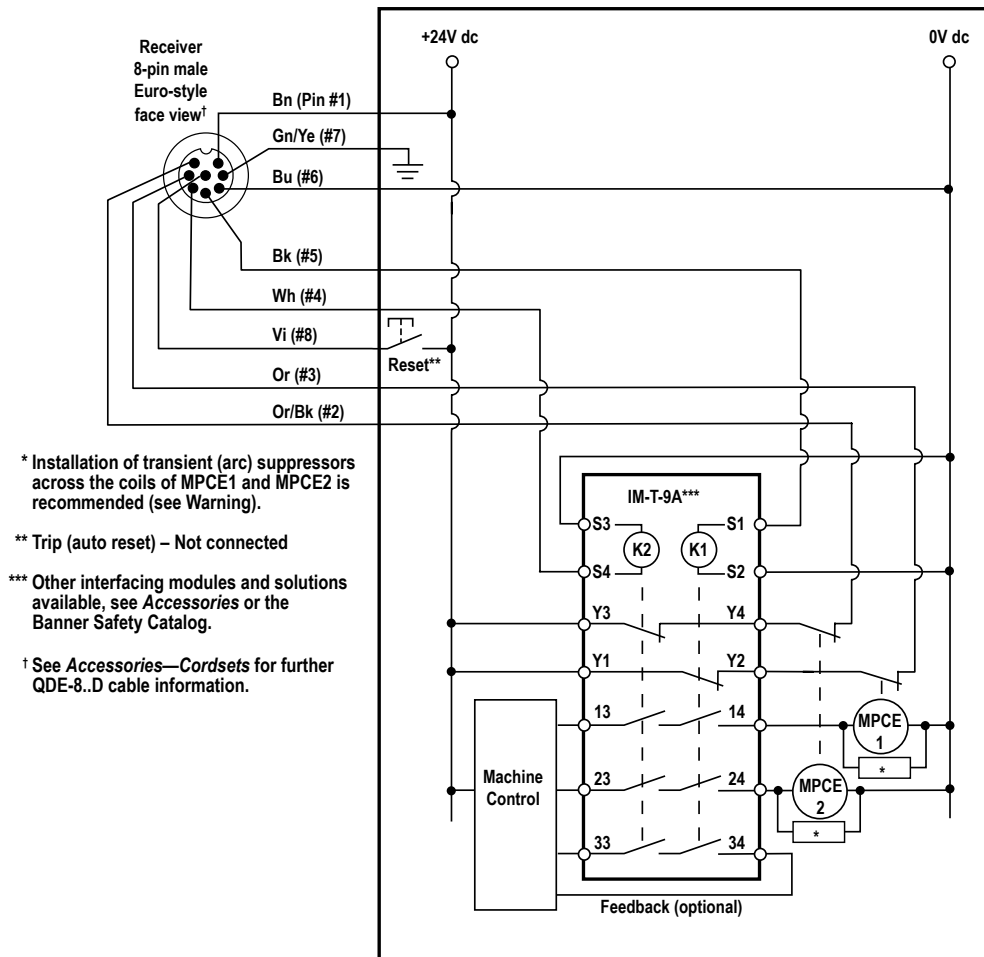

Figure 22. Interface Module (2-channel EDM, with reset)—Generic Receiver Wiring

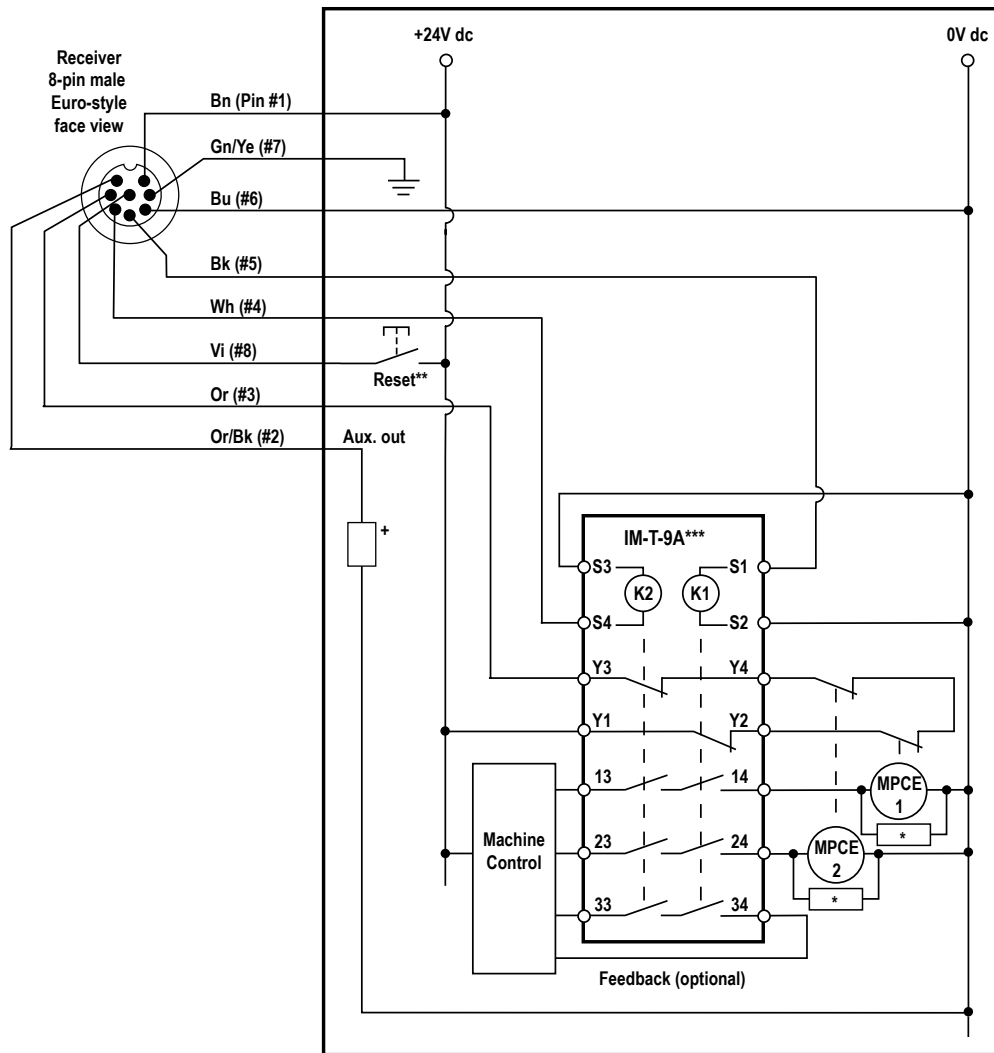

Figure 23. Interface Module (1-channel EDM, with reset)—Generic Receiver Wiring

* Installation of transient (arc) suppressors across the coils of MPCE1 and MPCE2 is recommended.

** Trip (auto reset) — Not connected

*** Other interfacing modules and solutions available.

† See [Cordsets](#) on p. 17 for more QDE-8D cordset information.

WARNING:

- **Properly install arc or transient suppressors**
- Failure to follow these instructions could result in serious injury or death.
- Install any suppressors as shown across the coils of the machine primary control elements. Do not install suppressors directly across the output contacts of the safety or interface module. In such a configuration, it is possible for suppressors to fail as a short circuit.

6 Operating Instructions

6.1 Security Protocol

Certain procedures for installing, maintaining, and operating the EZ-SCREEN must be performed by either Designated Persons or Qualified Persons.

A **Designated Person** is identified and designated in writing, by the employer, as being appropriately trained and qualified to perform system resets and the specified checkout procedures on the EZ-SCREEN. The Designated Person is empowered to:

- Perform manual resets and hold possession of the reset key
- Perform the Daily Checkout Procedure

A **Qualified Person**, by possession of a recognized degree or certificate of professional training, or by extensive knowledge, training, and experience, has successfully demonstrated the ability to solve problems relating to the installation of the EZ-SCREEN System and its integration with the guarded machine. In addition to everything for which the Designated Person is empowered, the Qualified Person is empowered to:

- Install the EZ-SCREEN System
- Perform all checkout procedures
- Make changes to the internal configuration settings
- Reset the System following a Lockout condition

6.2 System Configuration Settings

Set the System settings using the configuration panels located on each sensor, behind the access cover. The access cover is opened by first removing the factory-installed security plate with the security hex wrench provided. Re-install the security plate after any configuration changes.

Figure 24. EZ-SCREEN Configuration DIP Switches (Receiver)

SC1 or SC2—Scan Code 1 (default) or Scan Code 2

T or L (Bank A)—Trip (T) (default) or Latch (L) Output

RR or Off—Reduced Resolution (default: Off)

T or L (Bank B)—Trip (T) (default) or Latch (L) Output ; the switch settings for bank A and bank B must match

RR or Off (Bank B)—Reduced Resolution (default: Off); the switch settings for bank A and bank B must match

E1 or E2—EDM 1-Channel or EDM 2-Channel (default); if the EDM wiring does not match the switch position shown (E2), an EDM error occurs and fixed blanking or cascade configuration will not be allowed.

Because it has redundant microprocessors, the receiver has two DIP switch banks (bank A and bank B) that must be set identically. Failure to do so will cause a Lockout condition when power is applied. Power to the EZ-SCREEN receiver should be OFF when changing DIP switch settings or a Lockout will occur.

After configuration settings are verified/set, fully close (snap shut) the access cover to maintain IP ratings. Other than the Scan Code, all configuration settings should be changed only when the System is off.

Note: The corresponding pairs of DIP switches must be set identically for the System to operate.

Scan Code allows the operation of multiple pairs of emitters and receivers in close proximity. Set the Scan Code to 1 or 2 using the switch on the configuration panel. The Scan Code setting for each emitter must match with its corresponding receiver. The Scan Code settings may be changed while in Run mode without causing a Lockout.

Trip or Latch Output operation is selected on two DIP switches in the receiver configuration port. Set both switches to the same setting. If they have different settings, an error code displays. If the switches are set for Trip Output (T), the System will auto-reset. If the switches are set for Latch Output (L), the System will require a manual reset.

External Device Monitoring (EDM)/Aux. Output—Select EDM mode via a 2-position DIP switch in the receiver configuration port. For 1-Channel Monitoring, set the EDM DIP switch to the E1 position. For 2-Channel Monitoring or No Monitoring, set the switch to the E2 position. See [Machine Primary Control Elements and EDM Input](#) on p. 42 for more information. When 1-Channel Monitoring is selected, an auxiliary (aux.) output is available; see [Auxiliary \(Aux.\) Output](#) on p. 43.

Reduced Resolution—Enable two-beam Reduced Resolution by selecting “RR” on both DIP switches as labeled. Enabling Reduced Resolution affects the Minimum Separation Distance (see [Calculating the Safety Distance \(Minimum Distance\)](#) on p. 21).

6.2.1 Access the Configuration Panel

Before making any changes to the DIP switch configuration, follow these instructions to open the access panel.

1. Remove the security plate using the security plate tool supplied.

2. Using a small flat blade screwdriver or the security plate tool, push the plastic tab on the access cover inwards at a 45° angle.

3. Pivot the screwdriver against the bevel until the access cover pops open.
4. Make your changes to the DIP switch settings.
5. To close the access cover, push cover into place until it "snaps" into place. The access cover has been designed to be removable, so if it should come off, snap it back onto the hinge and close it.
6. Replace the security plate with the tamper-resistant screws provided, using the security plate tool.

It is important to snap-close the cover to maintain the sensors' IP65 environmental rating. If an access cover is lost or damaged, order a replacement from the factory (see [Replacement Parts](#) on p. 90). For installations subject to shock and vibration, always reinstall the security plate.

6.2.2 Inverted Display

To invert the display, use a push button located under the access cover. Invert the display when an emitter and receiver are mounted with the QD connector ends up. A replacement access cover with an inverted label is included with each emitter and receiver to accommodate inverted mounting.

6.2.3 Selectable Trip/Latch Outputs

The setting for Trip or Latch Output determines whether the System will enter RUN mode automatically after power-up, or if it will require a manual reset first. If the System is set for Trip Output, other measures must be taken to prevent a pass-through hazard.

- If Trip Output is selected, the OSSD outputs will turn ON after power is applied and the receiver passes its internal self-test/synchronization and recognizes that all beams are clear. The OSSD outputs will also turn on after all beams are cleared following a blocked beam.
- If Latch Output is selected, the EZ-SCREEN requires a manual reset for the OSSD outputs to turn ON, whenever power is applied and all beams are clear, or following a blocked beam.

WARNING:

- **Use of automatic (trip) or manual (latch) start/restart**
- Failure to follow these instructions could result in a serious injury or death.
- Applying power to the Banner device, clearing the defined area, or resetting a latch condition must not initiate dangerous machine motion. Design the machine control circuitry so that one or more initiation devices must be engaged to start the machine (a conscious act), in addition to the Banner device going into Run mode.

6.3 Reset Procedures

System resets are performed using an external reset switch. This switch must be located outside the guarded area, and must not be within reach from within the guarded area (see [Reset Switch Location](#) on p. 25). Its location should provide a clear view of the entire safeguarded area. If any hazardous areas are not in view from the switch location, additional means of safeguarding must be provided. The switch should be protected from accidental or unintended actuation (for example, through the use of rings or guards).

If supervisory control of the reset switch is required, a key switch may be used, with the key kept in the possession of a Designated or Qualified Person. Using a key switch provides some level of personal control, since the key may be removed from the switch. This hinders a reset while the key is under the control of an individual, but must not be relied upon solely to guard against accidental or unauthorized reset. Spare keys in the possession of others or additional personnel entering the safeguarded area unnoticed may create a hazardous situation.

6.3.1 Manual Resets and Lockout Conditions

Reset Routine—The EZ-SCREEN requires a manual reset to clear a Power-Up Lockout or Latch condition, and after the cause of a Lockout condition is corrected. This function is designed to provide a monitored manual reset (that is, an open-closed-open action), such that a shorted or tied-down button cannot cause a reset. When a key-operated switch is used, it is typically called a key reset.

To perform a manual reset, close the normally open switch for at least 0.25 second, but no longer than 2 seconds, and then re-open the switch.

A Lockout condition causes the EZ-SCREEN OSSD outputs to turn Off. A Lockout condition is indicated by a flashing red emitter or receiver Status indicator and an error number displayed on the Diagnostic Display. Internal Lockout conditions require a manual reset routine to return the System to Run mode after the failure has been corrected and the input has been correctly cycled. A description of possible lockouts, their causes, and troubleshooting hints are listed in [Troubleshooting](#) on p. 78.

Trip Output/Auto Reset—While the use of a reset switch is recommended, it is not required for EZ-SCREEN receivers that are configured for Trip Output (automatic reset). Cycling the supply power (Off for > 2 seconds, then On) also clears lockouts if their cause has been corrected. If a reset switch is not used, leave pin 8 (violet wire) not connected (open) and secure it against shorting to a source of power or ground.

6.3.2 Resetting the Receiver

The EZ-SCREEN receiver has a Reset input, pin 8 (Violet wire), that allows the System to be manually reset.

The EZ-SCREEN requires a manual reset to clear a Latch condition and resume operation following a stop command. Internal Lockout conditions also require a manual reset to return the System to Run mode after the failure has been corrected and the input correctly cycled.

Receiver manual resets are required in the following situations:

- Trip Output operation—only after a System Lockout
- Latch Output operation—at power-up, after each Latch condition occurs, and after a System Lockout

To reset the receiver:

1. Close the reset switch for 1/4 to 2 seconds. (If the reset switch model MGA-KS0-1 is used, turn the key 1/4 turn clockwise to close.)
2. Open the switch. (If the reset switch model MGA-KS0-1 is used, turn the key counterclockwise, back to its original position, to open.)

Important: Closing the reset switch too long causes the System to ignore the reset request. The switch must be closed from 1/4 second to 2 seconds, but no longer.

6.3.3 Resetting the Emitter

In the rare occurrence that an emitter requires a reset, power the sensor down, then power it up. Emitter resets are needed only if a Lockout occurs.

6.4 Status Indicators

Status indicators on both the emitter and receiver are clearly visible on each sensor's front panel.

Emitter:

Key	Description
A	Status Indicator (Red/Green)—shows whether power is applied, and whether the emitter is in Run mode, TEST mode, or Lockout condition.
B	1-digit Diagnostic Display—indicates specific error or configuration conditions.

Figure 25. Emitter

Receiver:

Key	Description
A	Reset indicator (Yellow)—shows System status: <ul style="list-style-type: none"> • Run mode (ON) • Waiting for a reset (flashing)
B	Status indicator (Red/Green)—shows System status: <ul style="list-style-type: none"> • Reduced Resolution enabled (flashing green) • Outputs are ON or OFF (green ON or red ON) • The System is in Lockout condition (flashing red)
C	3-Digit Diagnostic Display—indicates specific error, configuration conditions, or total number of blocked beams.
D	Zone indicators (Red/Green)—each shows status of approximately 1/8 of the total beams: <ul style="list-style-type: none"> • Aligned and clear (green ON) • Blocked and/or misaligned (red ON) • Fixed blanked area (flashing green)
E	Zone 1 Indicator—indicates beam synchronization status

Figure 26. Receiver

6.4.1 Emitter Status Indicators

A single bi-color red/green Status indicator shows whether power is applied, and whether the emitter is in Run mode, optional Test mode, or Lockout status. A Diagnostic Display indicates a specific error code when the emitter is in Lockout; the display also momentarily indicates the scan code setting at power-up or when changed.

Operating Status	Required Event	Status Indicator	Diagnostic Display
Power-up	Apply Power	Red single-flash	Scan code flash 3 times, alternates  then  or  then 
Run Mode	Passes internal tests	Green	
Test Mode	Open Test switch	Flashing green	
Lockout	Internal/external fault	Flashing red	Displays error code (see Troubleshooting on p. 78)

6.4.2 Receiver Status Indicators

Bi-color Red/Green Zone indicators show whether a section of the defined area is aligned and clear, or is blocked and/or misaligned. A Yellow Reset indicator shows when the System is in Run mode or is waiting for a reset. There are 8 Zone indicators for all model lengths, each of which indicates Blocked/Clear conditions for approximately 1/8 of the total light screen.

A bi-color Red/Green Status indicator shows when the OSSD outputs are ON (Green) or OFF (Red), or the System is in Lockout status (flashing Red). The Diagnostic Display indicates the receiver's trip (-) or latch (L) configuration setting and displays a specific error code when the receiver is in Lockout. The Diagnostic Display also momentarily indicates the scan code at power-up or when changed.

Receiver Indicators when Configured for Trip Output

Operating Mode	Required Event	Reset Indicator	Status Indicator	Zone Indicators	Diagnostic Displays	OSSD Outputs
Power-up	Apply power	Off	Single-Flash Red	All Single-Flash Red	Scan code flashes 3 times, alternates  then  or  then 	Off
Alignment Mode - Beam 1 Blocked	Pass internal tests	Off	Off	Zone 1 Red ⁶ Others Off	  	Off
Alignment Mode - Beam 1 Clear	Align Beam 1	On	Red	Zone 1 Green Others Red or Green	Total number of blocked beams	Off
Run Mode - Clear	Align all beams	On	On or Flashing Green ⁷	All On Green	Off  Off	On
Run Mode - Blocked	Beam(s) blocked	On	Red	Red or Green ⁶	Total number of blocked beams	Off

⁶ If beam 1 is blocked, Zone indicators 2-8 will be Off, because beam 1 provides the synchronization signal for all the beams.

⁷ Flashing if Reduced Resolution is enabled.

Operating Mode	Required Event	Reset Indicator	Status Indicator	Zone Indicators	Diagnostic Displays			OSSD Outputs
Noise Detected - Reset Interface					Flashing 	Continues previous reading	Continues previous reading	
Noise Detected - EDM Interface					Continues previous reading	Continues previous reading	Flashing 	
Lockout	Internal/external fault	Off	Flashing Red	All Off	Displays error code (see Troubleshooting on p. 78)			Off

Receiver Indicators when Configured for Latch Output

Operating Mode	Required Event	Reset Indicator	Status Indicator	Zone Indicators	Diagnostic Displays			OSSD Outputs
Power-up	Apply power	Off	Single-Flash Red	All Single-Flash Red	Scan code flashes 3 times, alternates  then  or  then 			Off
Alignment Mode - Beam 1 Blocked	Pass internal tests	Off	Off	Zone 1 Red ⁸ Others Off				Off
Alignment Mode - Beam 1 Clear	Align Beam 1	On	Red	Beam 1 Green Others Red or Green	Total number of blocked beams			Off
Alignment Mode - All Beams Clear	Align all beams	Double-flash	Red	All on Green	Off		Off	Off
Run Mode - Clear	Perform reset	On	On or Flashing Green ⁹	All On Green	Off		Off	On
Latched - Blocked Beam 1 Blocked	Block Beam 1	On	Red	Red or Green ⁸				Off
Latched - Blocked Beam 1 Clear	Block 1 or More Beams	On	Red	Red or Green ⁸	Total number of blocked beams			Off
Latched - Clear	Clear all beams	Flashing	Red	All On Green	Off		Off	Off
Noise Detected - Reset Interface					Flashing 	Continues previous reading	Continues previous reading	

⁸ If beam 1 is blocked, Zone indicators 2–8 will be Off, because beam 1 provides the synchronization signal for all the beams.

⁹ Flashing if Reduced Resolution is enabled.

Operating Mode	Required Event	Reset Indicator	Status Indicator	Zone Indicators	Diagnostic Displays			OSSD Outputs
Noise Detected - EDM Interface					Continues previous reading	Continues previous reading	Flashing 	
Lockout	Internal/external fault	Off	Flashing Red	All Off	Displays error code (see Troubleshooting on p. 78)			Off

6.4.3 Status Indicators for Cascaded Applications

When multiple light screens are cascaded, some unique indications may occur.

When a receiver's CSSI input is in a Stop condition (because of a blocked light screen further upstream in the cascade or because of a Stop signal from an E-stop button, for example), the display on the downstream receivers, including the master receiver, will be bracketed by a pair of vertical "goalposts."

Receiver #1 (Master)				
Condition	OSSDs	Display	Reset Indicator	Status Indicator
Clear	On		On	Green
CSSI Stop (Receiver #2, 3, or 4 is blocked)	Off		On	Red
Latch	Off		Flashing	Red

Receiver #2, 3, or 4				
Condition	OSSDs	Display	Reset Indicator	Status Indicator
Clear	On		On	Green
Blocked	Off	# of beams blocked	On	Red
CSSI Stop (Receiver upstream is blocked)	Off		On	Red
Cleared	On		On	Green

6.5 Normal Operation

6.5.1 System Power-Up

The EZ-SCREEN powers up in one of two ways, depending on the trip/latch output configuration. If it is set for trip output, it powers up and resets automatically; if it is set for latch output, it requires a manual reset procedure after the power-up and sensor alignment.

Trip Output Power-Up: When power is applied, each sensor conducts self-tests to detect critical internal faults, determine configuration settings, and prepare the EZ-SCREEN for operation. If either sensor detects a critical fault, scanning ceases, the receiver outputs remain Off and diagnostic information displays on the sensor's Diagnostic Display. If no faults are detected, the EZ-SCREEN automatically enters Alignment mode, and the receiver looks for an optical sync pattern from the emitter. If the receiver is aligned and receives the proper sync pattern, it enters Run mode and begins scanning to determine the blocked or clear status of each beam. No manual reset operation is required.

Latch Output Power-Up: When power is applied, each sensor conducts self-tests to detect critical internal faults, determine configuration settings, and prepare for operation. If either sensor detects a critical fault, scanning ceases, the receiver outputs remain Off and diagnostic information is displayed on the sensor's Diagnostic Display. If no faults are detected, the EZ-SCREEN automatically enters Alignment mode, and the receiver looks for an optical sync pattern from the emitter. If the receiver is aligned and receives the proper sync pattern, it begins scanning to determine the blocked or clear status of each beam. When all beams are aligned, the Yellow Reset indicator double-flashes to indicate the EZ-SCREEN is waiting for a manual reset. After a valid manual reset, the EZ-SCREEN enters Run mode and continues scanning.

6.5.2 Run Mode

Trip Output Configuration—If any beams become blocked while the EZ-SCREEN is running with Trip Output selected, the receiver outputs turn OFF within the stated EZ-SCREEN response time (see [Components](#) on p. 15). If all the beams then become clear, the receiver outputs come back ON. No resets of any kind are needed. All required machine control resets are provided by the machine control circuit.

Latch Output Configuration—If any beams become blocked while the EZ-SCREEN is running with Latch Output selected, the receiver outputs turn OFF within the stated EZ-SCREEN response time (see [Components](#) on p. 15). If all the beams then become clear, the receiver Zone indicators will all be Green and the Reset indicator will single-flash, indicating the EZ-SCREEN is waiting for a manual latch reset. In Latch Output operation, the outputs come back ON only when all beams are clear and after a manual reset. The EZ-SCREEN will wait for a manual reset; when a valid reset signal is received and all beams remain clear, the receiver outputs turn ON.

Internal Faults (Lockouts)—If either sensor detects a critical fault, scanning ceases, the receiver outputs turn OFF and diagnostic information is displayed through the sensor's front window. See [Troubleshooting](#) on p. 78 for resolution of error/fault conditions.

6.6 Periodic Checkout Requirements

To ensure continued reliable operation, the System must be checked out periodically. Banner Engineering highly recommends performing the System checkouts as described below. However, a Qualified Person should evaluate these recommendations, based on the specific application and the results of a machine risk assessment, to determine the appropriate content and frequency of checkouts.

At every shift change, power-up, and machine setup change, the Daily Checkout should be performed; this checkout may be performed by a Designated or Qualified Person.

Semi-annually, the System and its interface to the guarded machine should be thoroughly checked out; this checkout must be performed by a Qualified Person (see [Checkout Procedures](#) on p. 60). A copy of these test results should be posted on or near the machine.

Whenever changes are made to the System (either a new configuration of the EZ-SCREEN System or changes to the machine), perform the Commissioning Checkout.

**Note: Verify Proper Operation**

The EZ-SCREEN can operate as it is designed only if it and the guarded machine are operating properly, both separately and together. It is the user's responsibility to verify this, on a regular basis, as instructed in [Checkout Procedures](#) on p. 60. Failure to correct such problems can result in an increased risk of harm.

Before the System is put back into service, verify that the EZ-SCREEN System and the guarded machine perform exactly as outlined in the checkout procedures and any problem(s) are found and corrected.

7 Checkout Procedures

This section lists the schedule of checkout procedures and describes where each procedure is documented. Checkouts must be performed as described. Results should be recorded and kept in the appropriate place (for example, near the machine, and/or in a technical file).

Banner Engineering highly recommends performing the System checkouts as described. However, a qualified person (or team) should evaluate these generic recommendations considering their specific application and determine the appropriate frequency of checkouts. This will generally be determined by a risk assessment, such as the one contained in ANSI B11.0. The result of the risk assessment will drive the frequency and content of the periodic checkout procedures and must be followed.

7.1 Schedule of Checkouts

Checkout cards and this manual can be downloaded at <http://www.bannerengineering.com>.

Checkout Procedure	When to Perform	Where to Find the Procedure	Who Must Perform the Procedure
Trip Test	At Installation Any time the System, the guarded machine, or any part of the application is altered.	Trip Test on p. 38	Qualified Person
Commissioning Checkout	At Installation Whenever changes are made to the System (for example, either a new configuration of the EZ-SCREEN or changes to the guarded machine).	Commissioning Checkout on p. 60	Qualified Person
Shift/Daily Checkout	At each shift change Machine setup change Whenever the System is powered up During continuous machine run periods, this checkout should be performed at intervals not to exceed 24 hours.	Daily Checkout Card (Banner p/n 113361 for SLS.. models and 118173 for SLSC.. models) A copy of the checkout results should be recorded and kept in the appropriate place (for example, near or on the machine, in the machine's technical file).	Designated Person or Qualified Person
Semi-Annual Checkout	Every six months following System installation, or whenever changes are made to the System (either a new configuration of the EZ-SCREEN or changes to the machine).	Semi-Annual Checkout Card (Banner p/n 113362) A copy of the checkout results should be recorded and kept in the appropriate place (for example, near or on the machine, in the machine's technical file).	Qualified Person

7.2 Commissioning Checkout

WARNING:

- **Do not use the system until the checkouts are verified**
- Attempts to use the guarded/controlled machine before these checks are verified could result in serious injury or death.
- If all these checks cannot be verified, do not attempt to use the safety system that includes the Banner device and the guarded/controlled machine until the defect or problem has been corrected.

Perform this checkout procedure as part of the System installation after the System has been interfaced to the guarded machine, or whenever changes are made to the System (either a new configuration of the EZ-SCREEN or changes to the machine). A Qualified Person must perform the procedure. Checkout results should be recorded and kept on or near the guarded machine as required by applicable standards.

To prepare the System for this checkout:

1. Examine the guarded machine to verify that it is of a type and design compatible with the EZ-SCREEN System. See [Appropriate Applications and Limitations](#) on p. 9 for a list of appropriate and inappropriate applications.
2. Verify that the EZ-SCREEN is configured for the intended application.
3. Verify that the safety distance (minimum distance) from the closest danger point of the guarded machine to the defined area is not less than the calculated distance, per [Calculating the Safety Distance \(Minimum Distance\)](#) on p. 21.

4. Verify that:
 - Access to any dangerous parts of the guarded machine is not possible from any direction not protected by the EZ-SCREEN System, hard (fixed) guarding, or supplemental safeguarding, and
 - It is not possible for a person to stand between the defined area and the dangerous parts of the machine, or
 - Supplemental safeguarding and hard (fixed) guarding, as described by the appropriate safety standards, are in place and functioning properly in any space (between the defined area and any hazard) which is large enough to allow a person to stand undetected by the EZ-SCREEN.
5. If used, verify that all reset switches are mounted outside and in full view of the guarded area, out of reach of anyone inside the guarded area, and that means of preventing inadvertent use is in place.
6. Examine the electrical wiring connections between the EZ-SCREEN OSSD outputs and the guarded machine's control elements to verify that the wiring meets the requirements stated in [Electrical Connections to the Guarded Machine](#) on p. 40.
7. Inspect the area near the defined area (including work pieces and the guarded machine) for reflective surfaces (see [Adjacent Reflective Surfaces](#) on p. 27). Remove the reflective surfaces if possible by relocating them, painting, masking or roughening them. Remaining problem reflections will become apparent during the Trip Test.
8. Verify that power to the guarded machine is Off. Remove all obstructions from the defined area. Apply power to the EZ-SCREEN System. If the EZ-SCREEN is configured for Manual Power-Up, the amber Status indicator will be double-flashing. Perform a manual reset (close the reset switch for 0.25 to 2 seconds, then open the switch).
9. Observe the Status indicators and Diagnostic Display:
 - **Lockout:** Status flashing red; all others Off
 - **Blocked:** Status On red; one or more Zone indicators On red; Reset On amber
 - **Clear:** Status On green¹¹; all Zone indicators On green; Reset On amber
 - **Latch:** (defined area clear) Status On red; all Zone indicators On green; Reset double-flashing amber
10. A Blocked condition indicates that one or more of the beams is misaligned or interrupted. See the Optical Alignment procedure in the [Initial Checkout Procedure](#) on p. 34 section to correct this situation. If the System is in a Latch condition, perform a manual reset.
11. After the green and amber Status indicators are On, **perform the trip test** (in the [Initial Checkout Procedure](#) on p. 34 section) on each sensing field to verify proper System operation and to detect possible optical short circuits or reflection problems. **Do not continue until the EZ-SCREEN passes the trip test.**

Important: Do not expose any individual to any hazard during the following checks.

WARNING:

- **Clear the guarded area before applying power or resetting the system**
- Failure to clear the guarded area before applying power could result in serious injury or death.
- Verify that the guarded area is clear of personnel and any unwanted materials before applying power to the guarded machine or before resetting the system.

12. Apply power to the guarded machine and verify that the machine does not start up.
13. Interrupt (block) the defined area with the appropriate supplied test piece and verify that it is not possible for the guarded machine to be put into motion while the beam(s) is blocked.
14. Initiate machine motion of the guarded machine and, while it is moving, use the supplied test piece to block the defined area. Do not attempt to insert the test piece into the dangerous parts of the machine. Upon blocking any beam, the dangerous parts of the machine must come to a stop with no apparent delay.
15. Remove the test piece from the beam; verify that the machine does not automatically restart, and that the initiation devices must be engaged to restart the machine.
16. Remove electrical power to the EZ-SCREEN. Both OSSD outputs should immediately turn Off, and the machine must not be capable of starting until power is re-applied to the EZ-SCREEN.
17. Test the machine stopping response time, using an instrument designed for that purpose, to verify that it is the same or less than the overall system response time specified by the machine manufacturer.

Do not continue operation until the entire checkout procedure is complete and all problems are corrected.

¹¹ The status indicator flashes green if reduced resolution is enabled.

7.3 Shift/Daily Checkout

Perform the procedure contained on the **Daily Checkout** card at every shift change, power-up, and machine set-up change. During continuous machine run periods, this checkout should be performed at intervals not to exceed 24 hours.

A **Designated Person** or **Qualified Person** (as defined in the [Glossary](#) on p. 92) must perform the procedure. A copy of checkout results should be recorded and kept in the appropriate place (for example, near or on the machine, in the machine's technical file).

Refer to the procedure detailed on the **Daily Checkout** card (Banner p/n 113361 for SLS.. models, P/N 118173 for SLSC.. models) in the documentation packet included with the receiver. If the Daily Checkout card is missing, contact Banner Engineering or download a copy of the card at <http://www.bannerengineering.com>.

7.4 Semi-Annual (Six-Month) Checkout

Perform the procedure on the **Semi-Annual Checkout** card every six months following System installation, or whenever changes are made to the System (either a new configuration of the EZ-SCREEN or changes to the machine).

A **Qualified Person** (as defined in the [Glossary](#) on p. 92) must perform the procedure. A copy of checkout results should be recorded and kept in the appropriate place (for example, near or on the machine, in the machine's technical file).

Refer to the procedure on the **Semi-Annual Checkout** card (Banner p/n 113362) in the documentation packet included with the receiver. If the **Semi-Annual Checkout** card is missing, contact Banner Engineering or download a copy of the card at <http://www.bannerengineering.com>.

8 Cascade

8.1 Overview of Cascading

EZ-SCREEN emitters and receivers are also available in cascadable models. These models can be used as stand-alone light screens, or can be cascaded up to four systems. The cascaded sensor pairs can be any length, any number of beams, or have different resolutions (14 mm and 30 mm), as long as each emitter matches its own receiver.

Special cabling is not required, but the double-ended 22 awg cordsets are recommended. Pigtail QD models may be used to reduce the number of required cables. Response time is dependent on the number of beams in the light screen and the light screen's position in the cascade. Maximum system response time can be calculated easily for these cascaded systems, in two ways:

- Individually for each light screen in the cascade (separation distance is calculated for each light screen in the cascade), or
- Based on the worst-case maximum for the entire cascade (all light screens in the cascade have the same separation distance).

Figure 27. Cascaded light screens guarding two areas of one machine

The receivers are shown using the EZA-MBK-21 "L" mounting bracket.

Note: EZ-SCREEN SLS models (with Inverted Display) can be used as the end sensor pair.

The control reliability, installation and alignment, electrical interface to the guarded machine, initial checkout, periodic checkout, troubleshooting and maintenance features of cascadeable models are functionally identical to those of the standard models. Electrical connections are made through M12 (or Euro-style) quick-disconnects. The emitter has an 8-pin connector for power and ground. Optional 5-pin emitters with Remote Test function are available; see note at right.

The receiver has an 8-pin connector for power, ground, reset, EDM #1 and #2, and OSSD #1 and #2. All systems in a cascade are activating the same set of OSSD outputs, which are the OSSDs of the master receiver.

Note: In a cascaded system, all receivers are connected together, and all emitters are connected together.

8.2 System Components and Specifications

A stand-alone cascadeable EZ-SCREEN system includes a compatible emitter and receiver (equal length and resolution; available separately or in pairs), a terminator plug for the receiver and two single-ended (machine interface) cables.

A multiple-light screen cascaded EZ-SCREEN system includes compatible emitter/receiver pairs (up to four), a terminator plug for the last receiver in the cascade, two single-ended cables to interface with the machine and provide power to the system, and pairs of double-ended (sensor interface) cables to interconnect the emitters and the receivers in the cascade.

The terminator plug must be used on the receiver in a stand-alone system, and on the last receiver in a multiple-system cascade or, a QDE2R4-8..D cable interfaced with an E-stop or other hard contacts (see [Emergency Stop Buttons and Rope/Cable Pulls](#) on p. 73 and [Positive-Opening Interlocking Safety Switches](#) on p. 75).

Available single-ended, double-ended, and splitter cables are listed in [Cordsets](#) on p. 17. Cable lengths are limited – for both the power cables and the interconnect cables; see [Determining Interconnect Cable Lengths](#) on p. 66 for more information.

Important: If a cascaded system requires the Remote Test function (see [Remote Test Input](#) on p. 44), then all emitters in the cascade must be 5-pin emitter models (model SLSCE...Q5); the interconnection between these cascaded emitters can only be accomplished using 5-pin DEE2R-5..D cables.

8.2.1 Cascadeable Emitter and Receiver Models with 14 mm Resolution

The 14 mm Resolution Cascadeable Models have a 0.1 m to 6 m (4 in to 20 ft) range. Only standard 8-pin QD models are listed; 8-pin emitters/receivers feature “swapable” wiring. see [Initial Electrical Connections](#) on p. 33 and [Sensor "Swapability"](#) on p. 44.

For cabling options, see [Cordsets](#) on p. 17.

Machine interface/power cables (one per end sensor, two per pair): Use QDE-..D cables.

Sensor interconnect cables (one per cascaded sensor, two per pair): Use DEE2R-..D cables.

Defined Area Height ¹²	Emitter (8-pin)	Receiver	Emitter/Receiver Pair	Number of Beams	Response Time (Tr) (ms)
300 mm (11.8 in)	SLSCE14-300Q8	SLSCR14-300Q8	SLSCP14-300Q88	40	15
450 mm (17.7 in)	SLSCE14-450Q8	SLSCR14-450Q8	SLSCP14-450Q88	60	19
600 mm (23.6 in)	SLSCE14-600Q8	SLSCR14-600Q8	SLSCP14-600Q88	80	23
750 mm (29.5 in)	SLSCE14-750Q8	SLSCR14-750Q8	SLSCP14-750Q88	100	27
900 mm (35.4 in)	SLSCE14-900Q8	SLSCR14-900Q8	SLSCP14-900Q88	120	32
1050 mm (41.3 in)	SLSCE14-1050Q8	SLSCR14-1050Q8	SLSCP14-1050Q88	140	36
1200 mm (47.2 in)	SLSCE14-1200Q8	SLSCR14-1200Q8	SLSCP14-1200Q88	160	40
1350 mm (53.1 in)	SLSCE14-1350Q8	SLSCR14-1350Q8	SLSCP14-1350Q88	180	43
1500 mm (59 in)	SLSCE14-1500Q8	SLSCR14-1500Q8	SLSCP14-1500Q88	200	48
1650 mm (65 in)	SLSCE14-1650Q8	SLSCR14-1650Q8	SLSCP14-1650Q88	220	52
1800 mm (70.9 in)	SLSCE14-1800Q8	SLSCR14-1800Q8	SLSCP14-1800Q88	240	56

Other available models:

To order the 5-pin emitters with Test input models, replace the suffix “Q8” with “Q5”, (e.g., SLSCE14-300Q5), and for the pair replace “Q88” with “Q85” (e.g., SLSCP14-300Q85). If a 5-pin emitter is used in the first (“master”) position in a cascaded system, then 5-pin emitters must be used in all other positions in that cascade.

To order the pigtail QD (8-pin models only), replace the “Q” in the model number with “P” (e.g., SLSCE14-300P8).

To order the ESD-safe models, add “N” to the model number, prior to the QD option designation (e.g., SLSCE14-300NQ8). ESD-safe models are not available with the pigtail QD option.

Optional housing finishes include the following. Add the model code before the QD designation in the model number:

- add “A” for a clear (brushed) anodized aluminum finish, black endcaps (e.g., SLSCE14-300AQ8),
- add “S” for a nickel-plated (“silver”) finish, black endcaps (e.g., SLSCE14-300SQ8),
- add “B” for a black painted finish, black endcaps (e.g., SLSCE14-300BQ8),
- add “W” for a white painted finish, black endcaps (e.g., SLSCE14-300WQ8), or
- add “SO” for a “safety orange” painted finish, black endcaps (e.g., SLSCE14-300SOQ8).

¹² 150 mm SLSC.. systems not available.

8.2.2 Cascadeable Emitter and Receiver Models with 30 mm Resolution

For cabling options, see [Cordsets](#) on p. 17. Only standard 8-pin QD models are listed; 8-pin emitters/receivers feature “swappable” wiring; see [Initial Electrical Connections](#) on p. 33 and [Sensor "Swapability"](#) on p. 44.

Machine interface/power cables (one per end sensor, two per pair): Use QDE-..D cables.

Sensor interconnect cables (one per cascaded sensor, two per pair): Use DEE2R-..D cables.

Defined Area Height ¹³	Emitter (8-pin)	Receiver	Emitter/Receiver Pair	Number of Beams	Response Time (Tr) (ms)
300 mm (11.8 in)	SLSCE30-300Q8	SLSCR30-300Q8	SLSCP30-300Q88	20	11
450 mm (17.7 in)	SLSCE30-450Q8	SLSCR30-450Q8	SLSCP30-450Q88	30	13
600 mm (23.6 in)	SLSCE30-600Q8	SLSCR30-600Q8	SLSCP30-600Q88	40	15
750 mm (29.5 in)	SLSCE30-750Q8	SLSCR30-750Q8	SLSCP30-750Q88	50	17
900 mm (35.4 in)	SLSCE30-900Q8	SLSCR30-900Q8	SLSCP30-900Q88	60	19
1050 mm (41.3 in)	SLSCE30-1050Q8	SLSCR30-1050Q8	SLSCP30-1050Q88	70	21
1200 mm (47.2 in)	SLSCE30-1200Q8	SLSCR30-1200Q8	SLSCP30-1200Q88	80	23
1350 mm (53.1 in)	SLSCE30-1350Q8	SLSCR30-1350Q8	SLSCP30-1350Q88	90	25
1500 mm (59 in)	SLSCE30-1500Q8	SLSCR30-1500Q8	SLSCP30-1500Q88	100	27
1650 mm (65 in)	SLSCE30-1650Q8	SLSCR30-1650Q8	SLSCP30-1650Q88	110	30
1800 mm (70.9 in)	SLSCE30-1800Q8	SLSCR30-1800Q8	SLSCP30-1800Q88	120	32
1950 mm (76.8 in)	SLSCE30-1950Q8	SLSCR30-1950Q8	SLSCP30-1950Q88	130	32
2100 mm (82.7 in)	SLSCE30-2100Q8	SLSCR30-2100Q8	SLSCP30-2100Q88	140	36
2250 mm (88.6 in)	SLSCE30-2250Q8	SLSCR30-2250Q8	SLSCP30-2250Q88	150	38
2400 mm (94.5 in)	SLSCE30-2400Q8	SLSCR30-2400Q8	SLSCP30-2400Q88	160	40

Other available models:

To order the 5-pin emitters with the Test input, replace suffix “Q8” with “Q5”, (e.g., SLSCE30-300Q5), and for the pair replace “Q88” with “Q85” (e.g., SLSCP30-300Q85). If a 5-pin emitter is used in the first (“master”) position in a cascaded system, then 5-pin emitters must be used in all other positions in that cascade.

To order the pigtail QD (8-pin models only) model, replace the “Q” in the model number with “P” (e.g., SLSCE30-300P8).

To order the ESD-safe models, add “N” to the model number, prior to the QD option designation (e.g., SLSCE30-300NQ8). ESD-safe models are not available with the pigtail QD option.

Optional housing finishes include the following. Add the model code before the QD designation in the model number:

- add “A” for a clear (brushed) anodized aluminum finish, black endcaps (e.g., SLSCE30-300AQ8),
- add “S” for a nickel-plated (“silver”) finish, black endcaps (e.g., SLSCE30-300SQ8),
- add “B” for a black painted finish, black endcaps (e.g., SLSCE30-300BQ8),
- add “W” for a white painted finish, black endcaps (e.g., SLSCE30-300WQ8), or
- add “SO” for a “safety orange” painted finish, black endcaps (e.g., SLSCE30-300SOQ8).

8.3 Receiver Display

In Run mode, the 7-digit display shows the following.

Condition	Display
Clear Condition—Latch output operation	

¹³ 150 mm SLSC.. systems not available.

Condition	Display
Clear Condition—Trip output operation	
Blocked	Number of blocked beams (sequential)
CSSI Input Off or open, for example, “upstream” receiver is blocked or in lockout	 Solid (not flashing)

8.4 Determining Interconnect Cable Lengths

The following cable length charts are possible combinations for each side of example cascaded systems. All cables are assumed to be 22 awg wire. Other lengths and combinations are possible; please call factory for assistance.

As the machine interface cable lengthens, the voltage drop increases, which results in shorter possible interconnect cables to maintain supply voltage requirements at the cascaded sensor. See [Cordsets](#) on p. 17 for a list of cordsets.

Table 4: Cable length options for two cascaded light screens

Recommended cable pairing per side of cascaded system

Machine Interface Cable (L1) QDE-..D		1 ft	3 ft	15 ft	25 ft	50 ft
Maximum L2 ¹⁴		200 ft	200 ft	175 ft	135 ft	50 ft
Sensor Interconnect Cable Lengths (L2)	Individual DEE2R-..D cables (ft)	100	100	100	100	
		75	75	75	75	
		50	50	50	50	50
		25	25	25	25	25
		15	15	15	15	15
		3	3	3	3	3
		1	1	1	1	1

Example 1:

Machine Interface Cable (L1): 15 ft

Sensor Interconnect Cable (L2): 175 ft (Using one 100 ft and one 75 ft DEE2R cables) or 100 ft or shorter using single cables

Example 2:

Machine Interface Cable (L1): 50 ft

Sensor Interconnect Cable (L2): 50 ft or shorter

¹⁴ Multiple DEE2R-..D cables may be required.

Table 5: Cable length options for three cascaded light screens

Recommended cable pairing per side of cascaded system

Machine Interface Cable (L1) QDE-..D		1 ft		3 ft		15 ft		25 ft	
		L2 (ft)	L3 (ft)	L2 (ft)	L3 (ft)	L2 (ft)	L3 (ft)	L2 (ft)	L3 (ft)
	Max. L2 (ft)	115	1	110	1	80	1	60	1
	Max. L3 (ft)	1	200	1	200	1	155	1	110
Sensor Interconnect Cable Lengths (L2, L3)	Individual DEE2R-..D cables ¹⁵	100	15	100	15				
		75	75	75	50	75	15		
		50	100	50	100	50	50	50	15
		25	100	25	100	25	100	25	50
		15	100	15	100	15	100	15	75
		3	100	3	100	3	100	3	100
		1	100	1	100	1	100	1	100

Example 1:

- Machine Interface Cable (L1): 3 ft
- Sensor Interconnect Cable (L2): 75 ft
- Sensor Interconnect Cable (L3): 50 ft

Example 2:

- Machine Interface Cable (L1): 15 ft
- Sensor Interconnect Cable (L2): 75 ft
- Sensor Interconnect Cable (L3): 15 ft

Because of the number of possible combinations, the following table includes only applications in which L2 = L4. A common installation example is one that protects two areas of a machine (for example, the front and back of a power press) and uses four EZ-SCREEN pairs to create two “L”-shaped sensing fields.

Table 6: Cable length options for four cascaded light screens

Recommended cable pairing per side of cascaded system

Machine Interface Cable (L1) QDE-..D		1 ft			3 ft			15 ft			25 ft		
		L2	L3	L4	L2	L3	L4	L2	L3	L4	L2	L3	L4
	Max. L3	1 ft	110 ft	1 ft	1 ft	105 ft	1 ft	1 ft	75 ft	1 ft	1 ft	45 ft	1 ft
Sensor Interconnect Cables (L2, L3 and L4)	Individual DEE2R-..D cables ¹⁶	50	15	50	50	15	50						
		25	50	25	25	50	25	25	25	25			
		15	75	15	15	75	15	15	25	15	15	15	15
		3	100	3	3	100	3	3	50	3	3	25	3
		1	100	1	1	100	1	1	75	1	1	25	1

¹⁵ Multiple DEE2R-..D cables may be required.

¹⁶ Multiple DEE2R-..D cables may be required.

Example 1:

- Machine Interface Cable (L1): 15 ft
- Sensor Interconnect Cable (L2): 1 ft
- Sensor Interconnect Cable (L3): 75 ft
- Sensor Interconnect Cable (L4): 1 ft

Example 2:

- Machine Interface Cable (L1): 15 ft
- Sensor Interconnect Cable (L2): 3 ft
- Sensor Interconnect Cable (L3): 50 ft
- Sensor Interconnect Cable (L4): 3 ft

8.5 Response Time for Cascaded Light Screens

Response time is an important factor in determining a light screen's safety distance (minimum distance). For cascaded EZ-SCREEN systems, that response time is dependent on the number of light screens, the number of beams in the light screens, and their positions in the cascade. It can be calculated easily, in two ways:

- Based on the worst-case time for the entire cascade (where all light screens in the cascade have the same safety distance)
- Individually for each light screen in the cascade (safety distance is calculated for each light screen in the cascade)

**WARNING:**

- **Properly install the device**
- Failure to follow the installation instructions can result in ineffective or non-operation of the Banner device, which could create an unsafe condition resulting in serious injury or death.
- Follow all installation instructions.

8.5.1 Individual Response Time and Separation Distance

When calculating individual separation distance for each emitter/receiver pair, the pair's position in the cascade affects its response time, which then affects its separation distance. This method results in the closest possible separation distance for each light screen.

Response time depends on how far downstream the light screen is from the machine control. Each light screen position in the cascade, starting from the first light screen in the cascade, increases the light screen's response time by 2 ms.

The 14 mm resolution, 300 mm EZ-SCREEN emitter/receiver pairs each begin with a response time of 15 ms.

The pair in position #1 (connected directly to the machine control), maintains its 15 ms response time. Response time for the second pair in the cascade circuit increases by 2 ms, to 17 ms; for the third pair by 4 ms, to 19 ms, and for the fourth pair by 6 ms, to 21 ms.

The formula used for U.S. applications (other standards may apply) to calculate separation distance for individual placement of each emitter/receiver pair in the cascaded system is:

$$\text{Position \#1: } D_s = K (T_s + T_r) + D_{pf}$$

$$\text{Position \#2: } D_s = K (T_s + T_r + 2 \text{ ms}) + D_{pf}$$

$$\text{Position \#3: } D_s = K (T_s + T_r + 4 \text{ ms}) + D_{pf}$$

$$\text{Position \#4: } D_s = K (T_s + T_r + 6 \text{ ms}) + D_{pf}$$

Use the above formulas in place of the D_s formula in [Calculating the Safety Distance \(Minimum Distance\)](#) on p. 21 to determine individual separation distance (D_s). This ensures each sensor pair is located at an adequate distance from the hazard.

8.5.2 Overall Response Time and Safety (Minimum) Distance

The cascaded system's Overall Response Time (T_r) is equal to the response time of the individual sensor pair with the most beams (the slowest individual response time), plus an adder resulting from the number of systems in the cascade. T_r can be found by the following formula:

$$T_r = T_{r(\max)} + [(N-1) \times 2 \text{ ms}]$$

where:

$T_{r(\max)}$ is the response time of the slowest individual pair in the cascade (the pair with the most beams; see [Components](#) on p. 15).

N is the number of sensor pairs in the cascade.

Use T_r value from the formula in [Calculating the Safety Distance \(Minimum Distance\)](#) on p. 21 to determine Overall Safety Distance (D_s). This will ensure that all sensor pairs will be located at an adequate distance from the hazard, no matter how the system is installed.

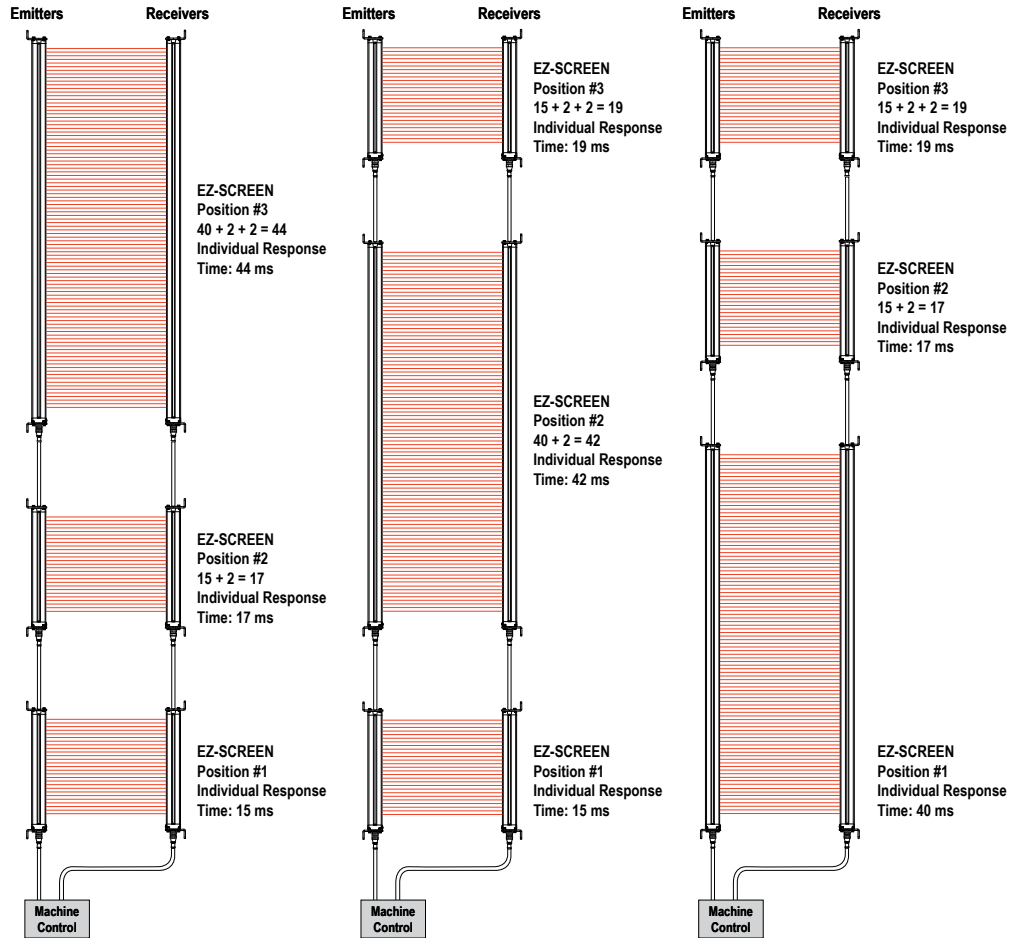

When contacts, for example, an E-stop button, are connected to a cascaded receiver, the CSSI response time is 40 ms plus the 2 ms adder for each additional light screen, similar to the defined area T_r .

$$T_{r(\text{CSSI})} = 40 \text{ ms} + [(N-1) \times 2 \text{ ms}]$$

8.5.3 Cascade Configuration vs. Response Time

When light screens of different lengths or different resolutions (and therefore different response times) are used in one circuit, their positions in the cascade may become a consideration.

For example, consider the light screen circuits shown. Each example contains three safety light screens, one 1200 mm (with a response time of 40 ms), and two 300 mm light screens (15 ms response each). Depending on their placement in the cascade, the individual response time for the same three light screens can vary from 40 to 44 ms.

System Overall Response Time for all systems shown here is $40 + [(3-1) \times 2 \text{ ms}] = 44 \text{ ms}$

8.6 Cascaded Sensor Configuration Settings

Setting cascaded sensors for scan code, trip or latch output, external device monitoring (EDM), reduced resolution, fixed blanking and inverted display is identical to the procedure for non-cascadeable emitters and receivers (see [Operating Instructions](#) on p. 50).

Scan codes for each emitter and receiver pair must match. However, for cascaded installations, scan codes must alternate on adjacent systems as described in [Installation of Multiple Systems](#) on p. 29.

WARNING:

- **Use a scan code**
- If you do not use a scan code, a receiver can synchronize to the signal from the wrong emitter, reducing the safety function of the light screen and creating an unsafe condition that could result in serious injury or death.
- Configure adjacent systems to use different scan codes (for example, set one system to use scan code 1 and the other system to use scan code 2). Perform a trip test to confirm the light screen function.

While the scan code, reduced resolution, fixed blanking, and inverted display settings are independent for each cascaded sensor pair, the trip/latch mode and EDM settings must be determined by the first receiver in the cascade (closest to the machine interface), which controls the OSSD outputs. All other receivers in the cascade must be set for trip mode and 2-channel EDM (factory default settings).

The settings on the first receiver then determine trip or latch mode and 1- or 2-channel EDM/aux. output, and this is the only receiver that requires a reset following a latch condition.

One or more areas within any cascaded EZ-SCREEN sensor pair can be blanked out, just as with other EZ-SCREEN light screens. Blanking for each sensor pair within a cascade, if required, must be programmed separately. See [Fixed Blanking](#) on p. 37.

8.6.1 Configure for Cascaded Operation

Configure each cascaded system before operating the system in a production environment.

Before configuration, install all emitters and receivers per [Installation Instructions](#) on p. 21 and [Cascade](#) on p. 63. The last receiver must be terminated either with a terminator plug or by connecting two closed mechanical contacts (see [Emergency Stop Buttons and Rope/Cable Pulls](#) on p. 73 and [Positive-Opening Interlocking Safety Switches](#) on p. 75).

WARNING:

- **Use a scan code**
- If you do not use a scan code, a receiver can synchronize to the signal from the wrong emitter, reducing the safety function of the light screen and creating an unsafe condition that could result in serious injury or death.
- Configure adjacent systems to use different scan codes (for example, set one system to use scan code 1 and the other system to use scan code 2). Perform a trip test to confirm the light screen function.

Perform the following procedure only on the first receiver in the cascade (closest to the machine interface).

1. From either normal operation or a power OFF condition, set the second and fifth DIP switches (RR and T/L) both to the left (RR and T position).
2. Set the third and fourth DIP switches (the second T/L and RR) both to the right (L and OFF position). The first and sixth DIP switches are not part of this process. Do not move them to match this figure.

3. The receiver should be in a lockout condition or the power is off.
 - If the power is off, apply power.
 - If the receiver is in a lockout condition, perform a valid reset sequence (close the reset switch for 0.25 to 2 seconds, then reopen).

Coming out of lockout or during startup, the DIP switch configuration will be recognized as Cascaded Teach Mode, indicated by the following:

- The first receiver display shows: For no e-stop connected (“4C,” “3C,” or “2C” on); for an e-stop with closed contacts (“4CE,” “3CE,” or “2CE” on); or for an e-stop with open contacts (“4CE,” “3CE” or “2CE” flashing)
 - The last cascaded receiver display shows: For a terminator connected (“1C” on); for an e-stop with closed contacts (“1CE” on; or for an e-stop with open contacts (“1CE” flashing)
 - All other receivers display “1C” on
 - All receiver Zone indicators are off
 - All receiver amber reset indicators are off
 - All receiver Status indicators are red
4. To enable and exit Cascade Teach Mode, reconfigure the DIP switches for normal operation.
 5. Perform a valid reset sequence or cycle the power.

8.7 Emergency Stop Buttons and Rope/Cable Pulls

Cascadeable EZ-SCREEN receivers may be connected to one or more emergency stop buttons. Connect the button(s) to the end of the last receiver in the cascade, in place of the terminator plug. The connected e-stop button(s) will activate/deactivate the OSSD outputs in all receivers in the cascade.

The number of e-stop buttons allowed in a series connection is limited by the total resistance per channel. The total resistance is the sum of all contact resistance values in the channel, plus the total wire resistance in the channel. The maximum total resistance per channel is 100 Ohms.

Important: The simultaneity between the two e-stop contacts, on opening and closing, is 3 seconds. If simultaneity is not met on either opening or closing, the first receiver's display flashes "|- - |." If simultaneity is not met on opening, the closed contact can be opened later (after more than 3 seconds), then both contacts must be closed again.

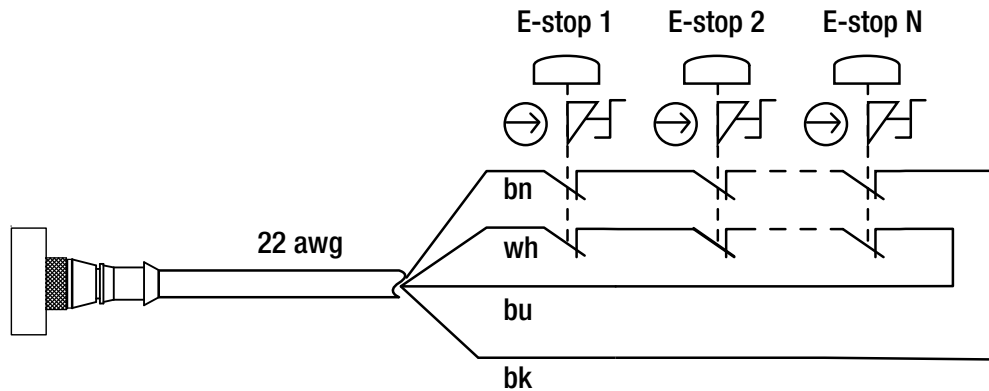

Figure 28. Wiring of emergency stop buttons to the last receiver in the cascade.

QDE2R4-8..D Cable Pinout ¹⁷		
Pin	Color	Description
1	brown (bn)	Ch 1a
2	black (bk)	Ch 1b
3	blue (bu)	Ch 2b
4		no connection
5		no connection
6		no connection
7		no connection
8	white (wh)	Ch 2a

WARNING:

- **Emergency Stop Functions**
- Muting or bypassing the safety outputs will render the Emergency Stop function ineffective.
- If Cascade Input is used for an Emergency Stop function, do not mute or bypass the safety outputs (OSSDs) of the EZ-SCREEN. NFPA79 requires that the Emergency Stop function remain active at all times.

¹⁷ Standard 8-pin M12/Euro-style QD cordsets can also be used, although the pin numbers and wire colors must be verified.

8.7.1 E-Stop Switch Requirements (Positive-Opening)

The E-stop switch must provide two contact pairs, which are closed when the switch is in the armed position. Once activated, the E-stop switch must open its contacts and return to the closed-contact position only after deliberate action (such as twisting, pulling, or unlocking).

The switch should be a positive-opening type, as described by IEC947-5-1. A mechanical force applied to such a button (or switch) is transmitted directly to the contacts, forcing them open. This ensures that the switch contacts open when the switch is activated.

ANSI/NFPA 79 specifies the following additional requirements:

- Emergency Stop push buttons shall be located at each operator control station and at other operating stations where emergency shutdown shall be required.
- Stop and Emergency Stop push buttons shall be continuously operable from all control and operating stations where located.
- Actuators of Emergency Stop devices shall be colored red. The background immediately around the device actuator shall be colored yellow. The actuator of a push-button-operated device shall be of the palm or mushroom-head type.
- The Emergency Stop actuator shall be a self-latching type.

Some applications may have additional requirements. The user must comply with all relevant regulations.

WARNING: Connecting multiple e-stop switches

- When two or more e-stop switches are connected to the same EZ-SCREEN receiver, the contacts of the e-stop switches must be connected together in series. This series combination is then wired to the respective EZ-SCREEN receiver input.
- Never connect the contacts of multiple e-stop switches in parallel to the EZ-SCREEN inputs; this defeats the switch contact monitoring ability of the EZ-SCREEN light curtain, and creates an unsafe condition which could result in serious bodily injury or death.
- Also, when two or more e-stop switches are used, each switch must be individually actuated (engaged), then re-armed and the EZ-SCREEN light curtain reset (if using latch mode). This allows the monitoring circuits to check each switch and its wiring to detect faults. Failure to test each switch individually in this manner could result in undetected faults and create an unsafe condition which could result in serious bodily injury or death.

WARNING:

- **Reset Routine Required**
- Allowing the machine to restart as soon as the e-stop switch is armed creates an unsafe condition that could result in serious injury or death.
- U.S. and international standards require that a reset routine be performed after returning the e-stop switch to its closed-contact position (when arming the e-stop switch). When automatic reset is used, establish an alternate means to require a reset routine after the e-stop switch is armed.

8.8 Interlock Switches in Cascaded Systems

The Cascade input may be used to monitor interlock safety gates or guards. Requirements vary widely for the level of control reliability or safety category (per ISO 13849-1) in the application of interlocked guards. While Banner Engineering recommends the highest level of safety in any application, the user is responsible to safely install, operate, and maintain each safety system, and comply with all relevant laws and regulations. Of the following applications, [Positive-Opening Interlocking Safety Switches](#) on p. 75 meets or exceeds the requirements for OSHA/ANSI control reliability and Safety Category 4, per ISO 13849-1.

WARNING:

- **The hazard must be accessible only through the sensing field**
- Incorrect system installation could result in serious injury or death.
- The installation of the EZ-SCREEN must prevent any individual from reaching around, under, over or through the defined area and into the hazard without being detected.
- See OSHA CFR 1910.217, ANSI B11.19, and/or ISO 14119, ISO 14120 and ISO 13857 for information on determining safety distances and safe opening sizes for your guarding device. Mechanical barriers (for example, hard (fixed) guarding) or supplemental safeguarding might be required to comply with these requirements.

8.8.1 Interlock Guarding Requirements

The following general requirements and considerations apply to the installation of interlocked gates and guards for the purpose of safeguarding. Refer to the relevant regulations to be sure to comply with all necessary requirements.

Hazards guarded by the interlocked guard must be prevented from operating until the guard is closed. A Stop command must be issued to the guarded machine if the guard opens while the hazard is present. Closing the guard must not, by itself, initiate hazardous motion; a separate procedure must be required to initiate the motion. The safety switches must not be used as a mechanical or end-of-travel stop.

The guard must be located at an adequate distance from the danger zone (so the hazard has time to stop before the guard is opened sufficiently to provide access to the hazard), and it must open either laterally or away from the hazard, not into the safeguarded area. Depending on the application, an interlocked gate or door should not be able to close by itself and activate the interlocking circuitry. In addition, the installation must prevent personnel from reaching over, under, around, or through the guard to the hazard. Any openings in the guard must not allow access to the hazard (see ANSI B11.19 or the appropriate standard). The guard must be strong enough and designed to protect personnel and contain hazards within the guarded area, which may be ejected, dropped, or emitted by the machine.

The safety switches and actuators used with the cascaded system must be designed and installed so that they cannot be easily defeated. They must be mounted securely, so that their physical position cannot shift, using reliable fasteners that require a tool to remove. Mounting slots in the housings are for initial adjustment only; final mounting holes must be used for permanent location.

8.8.2 Positive-Opening Interlocking Safety Switches

Two individually mounted safety interlock switches are recommended for each guard to meet safety category 4, per ISO 13849-1, and must satisfy several requirements. Each switch must provide at minimum, one normally closed (N/C) electrically isolated contact to interface with the Cascade input.

The contacts must be of positive-opening design, with one or more normally closed contacts rated for safety. Positive-opening operation causes the switch to be forced open, without the use of springs, when the switch actuator is disengaged or moved from its home position. Mount the switches to move/disengage the actuator from its home position and open the normally closed contact when the guard opens.

Figure 29. Monitoring two positive-opening interlocking safety switches

This application is considered to meet or exceed requirements for OSHA control reliability and safety categories 4 per ISO 13849-1.

8.8.3 Monitoring Series-Connected Positive-Opening Safety Switches

When monitoring two individually mounted safety switches (as shown in Figure 29 on p. 75), a faulty switch will be detected if it fails to switch as the guard opens. In this case, the EZ-SCREEN de-energizes its OSSD output and disables its reset function until the input requirements are met (i.e., the faulty switch is replaced). However, when a series of interlocking safety switches is monitored by the EZ-SCREEN, the failure of one switch in the system may be masked or not detected at all .

Figure 30. Monitoring positive-opening safety switches on multiple gates.

QDE2R4-8..D Cable Pinout ¹⁹		
Pin	Color	Description
1	brown (bn)	Ch 1a
2	black (bk)	Ch 1b
3	blue (bu)	Ch 2b
4		no connection
5		no connection
6		no connection
7		no connection
8	white (wh)	Ch 2a

¹⁸ Standard 8-pin M12/Euro-style QD cordsets can also be used, although the pin numbers and wire colors must be verified.

¹⁹ Standard 8-pin M12/Euro-style QD cordsets can also be used, although the pin numbers and wire colors must be verified.

**WARNING:**

- **Not a Safety Category 4 Application**
- Failure to verify the proper operation of each switch could result in serious injury or death.
- When monitoring multiple guards with a series connection of multiple safety interlock switches, a single failure may be masked or may not be detected. When such a configuration is used, regularly verify the proper operation of each switch.

Series-connected, positive-opening interlock switch circuits do not meet ISO 13849-1 Safety Category 4 and may not meet Control Reliability requirements because of the potential of an inappropriate reset or a potential loss of the safety stop signal. A multiple connection of this type should not be used in applications where loss of the safety stop signal or an inappropriate reset could lead to serious injury or death. The following two scenarios assume two positive-opening safety switches on each guard:

Masking of a failure. If a guard is opened but a switch fails to open, the redundant safety switch will open and cause the EZ-SCREEN to de-energize its outputs. If the faulty guard is then closed, both Cascade input channels also close, but because one channel did not open, the EZ-SCREEN will not reset.

However, if the faulty switch is not replaced and a second “good” guard is cycled (opening and then closing both of the cascade input channels), the EZ-SCREEN considers the failure to be corrected. With the input requirements apparently satisfied, the EZ-SCREEN allows a reset. This system is no longer redundant and, if the second switch fails, may result in an unsafe condition (i.e., the accumulation of faults results in the loss of the safety function).

Non-detection of a failure. If a good guard is opened, the EZ-SCREEN de-energizes its outputs (a normal response). But if a faulty guard is then opened and closed before the good guard is re-closed, the failure on the faulty guard is not detected. This system also is no longer redundant and may result in a loss of safety if the second safety switch fails to switch when needed.

The circuits in either scenario do not inherently comply with the safety standard requirements of detecting single faults and preventing the next cycle. In multiple-guard systems using series-connected positive-opening safety switches, it is important to periodically check the functional integrity of each interlocked guard individually.

Operators, maintenance personnel, and others associated with the operation of the machine must be trained to recognize such failures and be instructed to correct them immediately.

Open and close each guard separately while verifying that the EZ-SCREEN outputs operate correctly throughout the check procedure. Follow each gate closure with a manual reset, if needed. If a contact set fails, the EZ-SCREEN will not enable its reset function. If the EZ-SCREEN does not reset, a switch may have failed; that switch must be immediately replaced.

This check must be performed and all faults must be cleared, at a minimum, during periodic checkouts. If the application can not exclude these types of failures and such a failure could result in serious injury or death, then the safety switches must not be connected in series.

9 Troubleshooting

9.1 Troubleshooting and Lockout Conditions

Evaluate status indicators per [Status Indicators](#) on p. 53.

A Lockout condition causes all of the EZ-SCREEN OSSD outputs to turn or remain OFF, sending a stop signal to the guarded machine. Each sensor provides diagnostic error codes to assist in the identification of the cause(s) of lockouts (see [Receiver Error Codes](#) on p. 79 and [Emitter Error Codes](#) on p. 81 or the Diagnostic Error Code label supplied in the documentation pack).

The System provides easy methods for determining operating problems. A Lockout condition is indicated by the following:

Receiver		Emitter	
Reset indicator	OFF	Status indicator	Flashing Red
Status indicator	Flashing Red	Diagnostic Display	Error code (flashing)
Zone indicators	OFF		
Diagnostic display	Error code (flashing)		

9.2 Recovery Procedures

To recover from a Lockout condition, all errors must be corrected and a single sensor reset sequence must be performed as described below.

9.2.1 Emitter and Receiver Reset

Receiver Reset

Close the remote reset switch for 0.25 to 2 seconds and then open the switch (per [Reset Procedures](#) on p. 52), or power the sensor down, wait a second or two, then power it up.

Note: If the receiver is set for latch output, a manual reset using a remote switch, as described in [Reset Procedures](#) on p. 52, is required to resume full operation.

Emitter Reset

Power the sensor down, wait a second or two, and then power it up.

WARNING:

- **Lockouts and power failures indicate a problem**
- Attempts to continue to operate machinery by bypassing the Banner device or other safeguards is dangerous and could result in serious injury or death.
- A Qualified Person²⁰ must immediately investigate the problem.

WARNING:

- **Shut down the machinery before servicing**
- Servicing the Banner device or system while the hazardous machinery is operational could result in serious injury or death.
- The machinery to which the Banner device or system is connected must not be operating at any time during major service or maintenance. This might require lockout/tagout procedures (refer to OSHA1910.147, ANSI Z244-1, ISO 14118 or the applicable standard for controlling hazardous energy).

²⁰ A person who, by possession of a recognized degree or certificate of professional training, or who, by extensive knowledge, training and experience, has successfully demonstrated the ability to solve problems relating to the subject matter and work.

9.2.2 Advanced Diagnostics

In addition to the standard error codes, the EZ-SCREEN can display advanced diagnostic codes for factory troubleshooting and repair functions. These codes are generally not intended for field troubleshooting by the EZ-SCREEN user.

These advanced codes have three digits (alternating “Axx”/“Bxx”, where “xx” are two alpha-numeric characters). To display these codes:

- Hold the Reset input high (+24 V dc), or
- Hold the Invert Display button down for five seconds during a lockout condition.

If the advanced diagnostic codes are inadvertently displayed, hold the Invert Display button down for 5 seconds to return to the standard error code display.

9.2.3 Receiver Error Codes

Diagnostic Display	Error Descriptions and Causes	Appropriate Action
	Output Error This error is caused by: <ul style="list-style-type: none"> • One or both outputs being shorted to a power supply (high or low) • By shorting OSSD 1 to OSSD 2 • By an overload (greater than 0.5A) 	Disconnect the OSSD loads and reset the receiver. <ul style="list-style-type: none"> • If the error clears, the problem is in the OSSD load(s) or in the load wiring. • If the error continues with no load connected, replace the receiver.
	Reset Input Error This error occurs when the Reset switch is closed (or the wiring is shorted to +24V) during power-up.	Verify that the reset switch is in the open position. Reset the receiver per Emitter and Receiver Reset on p. 78. <ul style="list-style-type: none"> • If the error remains, disconnect the reset wire at pin 8; cycle the power. • If the error clears, the problem is in the reset switch or in the wiring. • If the error persists, replace the receiver.
	EDM Input Error This error can occur for the following reasons: <ul style="list-style-type: none"> • EDM wiring is incorrect • No connection to EDM connections • Both EDM inputs fail to respond within 250 ms of each other • Excessive noise on EDM inputs • Loose QD connection(s) 	Verify that the EDM wiring is correct for the EDM type configured (see Machine Primary Control Elements and EDM Input on p. 42). <ul style="list-style-type: none"> • If the error continues, remove power to the guarded machine, disconnect the OSSD loads, disconnect the EDM input signals, configure EDM for No Monitoring (see Machine Primary Control Elements and EDM Input on p. 42), and conduct the Initial Checkout procedure in Initial Checkout Procedure on p. 34. • If the error clears, the problem is in the external device contacts or wiring, or is a response-time problem of the external devices. Verify that the EDM wiring is correct and that the external devices meet the requirements described in Machine Primary Control Elements and EDM Input on p. 42. • If the error continues, check for noise on the EDM inputs (see Electrical and Optical Noise on p. 81). If the error persists, replace the receiver.
	Receiver Error This error occurs due to excessive electrical noise or an internal failure.	Reset the receiver per Emitter and Receiver Reset on p. 78. <ul style="list-style-type: none"> • If the error clears, perform a Daily Checkout procedure (per EZ-SCREEN Checkout Procedures: Shift and Daily Checkout Procedure; Daily Checkout Card). If the System checks out, resume operation. If the System fails, replace the receiver. • If the error continues, check the ground connection (pin 7). • If the sensor has a good earth ground connection to pin 7, perform the Initial Checkout procedure (per Initial Checkout Procedure on p. 34). • If the error clears, check the external connections and configuration settings. • If the error persists, replace the receiver.
	DIP Switch Error This error can be caused by incorrect DIP switch settings or by changes to the DIP switch settings when the system is ON.	<ul style="list-style-type: none"> • Verify that the DIP switch settings are valid. Make any corrections necessary and perform a receiver reset. • If the error occurred due to a change of the DIP switch settings while the System was in Run mode, verify the switch settings and perform a receiver reset to resume operation with the new switch settings and modified System configuration. • If the error continues, replace the receiver.

Diagnostic Display	Error Descriptions and Causes	Appropriate Action
	<p>EDM 1 Error</p> <p>This error can occur when the EDM 1 input signal fails to respond within 250 ms of the OSSDs changing state (ON to OFF).</p>	<p>Verify that the EDM wiring is correct and that the external devices meet the requirements described in Machine Primary Control Elements and EDM Input on p. 42.</p> <ul style="list-style-type: none"> • If the error continues, remove power to the guarded machine, disconnect the OSSD loads, disconnect the EDM input signals, configure EDM for No Monitoring (per Machine Primary Control Elements and EDM Input on p. 42), and conduct the Initial Checkout procedure in Initial Checkout Procedure on p. 34. • If the error clears, the problem is in the External Device contacts or wiring, or is a response-time problem of the external devices. Verify that the EDM wiring is correct and that the external devices meet the requirements described in Machine Primary Control Elements and EDM Input on p. 42. • If the error continues, check for noise on the EDM inputs (see Electrical and Optical Noise on p. 81).
	<p>EDM 2 Error</p> <p>The EDM 2 configuration is not valid.</p>	<ul style="list-style-type: none"> • Verify that the EDM wiring is correct and that the external devices meet the requirements described in Machine Primary Control Elements and EDM Input on p. 42. • If the error continues, remove power to the guarded machine, disconnect the OSSD loads, disconnect the EDM input signals, configure EDM for No Monitoring (per Machine Primary Control Elements and EDM Input on p. 42), and conduct the Initial Checkout procedure (see Initial Checkout Procedure on p. 34). • If the error clears, the problem is in the External Device contacts or wiring, or is a response-time problem of the external devices. Verify that the EDM wiring is correct and that the external devices meet the requirements described in Machine Primary Control Elements and EDM Input on p. 42. • If the error continues, check for noise on the EDM inputs (see Electrical and Optical Noise on p. 81).
	<p>Fixed Blanking Error</p> <p>This error occurs when beam(s) that have been blanked (programmed to ignore a fixed object) become clear when the object is removed or moved.</p>	<ul style="list-style-type: none"> • Reposition the object and perform a key reset (or cycle power). • Re-program (teach) the fixed blanked object(s), see Fixed Blanking on p. 37.
	<p>Programming Timeout Error</p> <p>This error occurs when the Fixed Blanking programming mode (teach) exceeds the ten-minute limit.</p>	<p>Re-program (teach) the fixed blanked object(s), see Fixed Blanking on p. 37.</p>
	<p>Cascade Configuration Error</p> <p>This error occurs when the configuration sequence is incorrectly followed, receiver(s) 2, 3 or 4 are configured, or receiver 1 is moved to a different position in the cascade.</p>	<ul style="list-style-type: none"> • The CSSI Input channel(s) are shorted together or to another source of power or ground. • Configure ONLY the first receiver in the cascade (connected to the machine interface). All other receivers must be set for 2-Ch. EDM (E2) and Trip Output (T), see Cascaded Sensor Configuration Settings on p. 71. • Re-configure the first receiver to adapt system to changes or replacement of other receivers, see Cascaded Sensor Configuration Settings on p. 71. <p>In a cascaded system, all receivers are connected together, and all emitters are connected together.</p>
	<p>Excessive Noise Error – Reset Interface</p> <p>This error occurs due to excessive levels of electrical noise.</p>	<ul style="list-style-type: none"> • Perform a reset per Reset Procedures on p. 52. • If the error clears, perform a Daily Checkout procedure (per Shift/Daily Checkout on p. 62) and if OK, resume operation. If the System fails the Daily Checkout procedure, replace the receiver.
	<p>Excessive Noise Error – EDM Interface</p> <p>This error occurs due to excessive levels of electrical noise.</p>	<ul style="list-style-type: none"> • If the error continues, check the ground connection (pin 7). • If the sensor has a good earth ground connection to pin 7, perform the Initial Checkout procedure (Initial Checkout Procedure on p. 34). • If the error clears, check for sources of electrical noise (see Electrical and Optical Noise on p. 81). • If the error continues, replace the receiver.
	<p>Excessive Noise Error – Cascade Input</p> <p>This error occurs due to excessive levels of electrical noise.</p>	

Diagnostic Display	Error Descriptions and Causes	Appropriate Action
 (flashing)	Cascade Input Simultaneity Operation of channels A and B mismatch > 3 seconds.	<ul style="list-style-type: none"> Check operation of Channel A and Channel B of cascade input. Cycle power or cycle the input. See Emergency Stop Buttons and Rope/Cable Pulls on p. 73 and Interlock Switches in Cascaded Systems on p. 74.

9.2.4 Emitter Error Codes

The emitter has only a 1-digit display. Two-digit codes are displayed sequentially.

Diagnostic Display	Error Description	Cause of Error and Appropriate Action
	Emitter Error This error can occur either due to excessive electrical noise or due to an internal failure.	Reset the emitter per Reset Procedures on p. 52. <ul style="list-style-type: none"> If the error clears, perform the daily checkout procedure (per EZ-SCREEN Checkout Procedures: Shift and Daily Checkout Procedure; Daily Checkout Card). If the System checks out, resume operation. If the System fails, replace the emitter. If the error continues, check the ground connection (see Generic Wiring Diagrams on p. 45). If the sensor has a good earth ground connection, check for electrical noise (see Electrical and Optical Noise on p. 81). If the error persists, replace the emitter.
	Excessive Noise Error This error can occur due to excessive electrical noise.	Reset the emitter per Reset Procedures on p. 52. <ul style="list-style-type: none"> If the error clears, perform the daily checkout procedure (per EZ-SCREEN Checkout Procedures: Shift and Daily Checkout Procedure; Daily Checkout Card). If the System checks out, resume operation. If the System fails, replace the emitter. If the error continues, check the ground connection (see Generic Wiring Diagrams on p. 45). If the sensor has a good earth ground connection, check for electrical noise (see Electrical and Optical Noise on p. 81). If the error persists, replace the emitter.

9.3 Test Mode for 5-Pin Emitters

If the System cannot be aligned or it will not go to a Green/Clear condition, the emitter's TEST input may be open. When this occurs, the receiver Reset indicator is amber, all Zone indicators will be red and the system Status LED will be red. The 3-digit display shows a numerical value equal to one less than the total number of beams. For example, if an array has 50 beams total, the display would show 49 and the emitter's Status indicator flashes green. See [Status Indicators](#) on p. 53 and [Troubleshooting](#) on p. 78. (On a 10-beam system, Zone 1 indicator is green and all others are red.)

Opening a switch or relay contacts connected to the TEST1 and TEST2 connections of the emitter, or supplying a voltage of less than 3 V dc to TEST1 only, simulates a Blocked condition, for testing purposes.

To verify proper operation, measure the voltage between TEST1 (pin 4, black) and dc COM (pin 3, blue) of the emitter:

- If the voltage is 10 V dc to 30 V dc, the emitter should be in Run mode and beam scanning should be occurring. If the emitter is not in Run mode:
 - Check the +24 V dc (pin 1, brown) to verify proper supply voltage. If the supply voltage is not within the rated supply voltage specifications, correct the supply voltage and recheck the emitter operation.
 - If the supply voltage is correct, Test1 is 10 V dc to 30 V dc, and the emitter does not operate properly (RUN mode with beam scanning), replace the emitter.
- If the voltage is less than 3 V dc, the emitter should be in Test mode and no scanning should be occurring. If the emitter is not in Test mode, replace the emitter.

9.4 Electrical and Optical Noise

The EZ-SCREEN is designed and manufactured to be highly resistant to electrical and optical noise and to operate reliably in industrial settings. However, serious electrical and/or optical noise may cause a random Trip. In very extreme electrical noise cases, a Lockout is possible. To minimize the effects of transitory noise, the EZ-SCREEN responds to noise only if the noise is detected on multiple consecutive scans.

If random nuisance Trips occur, check the following:

- Poor connection between the sensor and earth ground
- Optical interference from adjacent light screens or other photoelectrics
- Sensor input or output wires routed too close to noisy wiring

9.4.1 Check for Sources of Electrical Noise

It is important that the light screen sensors have a good earth ground. Without this, the System can act like an antenna and random Trips and Lockouts can occur.

All EZ-SCREEN wiring is low voltage; running these wires alongside power wires, motor/servo wires, or other high-voltage wiring can inject noise into the EZ-SCREEN System. It is good wiring practice (and may be required by code) to isolate EZ-SCREEN wires from high-voltage wires.

1. Use the Banner model BT-1 Beam Tracker Alignment Aid to detect electrical transient spikes and surges.
2. Cover the lens of the BT-1 with electrical tape to block optical light from entering the receiver lens.
3. Press the RCV button on the BT-1 and position the Beam Tracker on the wires going to the EZ-SCREEN or any other nearby wires.
4. Install proper transient suppression across the load to reduce the noise.

9.4.2 Check for Sources of Optical Noise

1. Turn off the emitter, completely block the emitter, or open the Test input.
2. Use a Banner BT-1 Beam Tracker (see [Accessories](#) on p. 83) to check for light at the receiver.
3. Press the RCV button on the BT-1 and move it across the full length of the receiver's sensing window. If the BT-1's indicator lights, check for emitted light from other sources (other safety light screens, grids or points, or standard photoelectric sensors).

10 Accessories

10.1 Interface Modules

IM-T-..A interface modules provide forced-guided, mechanically-linked relay (safety) outputs for the EZ-SCREEN System. See Banner datasheet p/n [62822](#) and wiring diagrams for more information.

Model	Description
IM-T-9A	Interface module, 3 normally open (N.O.) redundant-output 6 amp contacts
IM-T-11A	Interface module, 2 normally open (N.O.) redundant-output 6 amp contacts, plus 1 normally closed (N.C.) auxiliary contact

10.2 Contactors

The normally closed contacts are used in an external device monitoring (EDM) circuit. If used, two contactors per EZ-SCREEN System are required.

Model	Description
11-BG00-31-D-024	10 amp positive-guided contactor, 3 N.O., 1 N.C.
BF1801L024	18 amp positive-guided contactor, 3 N.O., 1 N.C. (N.C. contact rated at 10 amps)

10.3 Safety Controllers

Safety Controllers provide a fully configurable, software-based safety logic solution for monitoring safety and non-safety devices. For additional models and XS26 expansion modules, see instruction manual p/n [174868](#) (XS/SC26-2).

Non-Expandable Models	Expandable Models	Description
SC26-2	XS26-2	26 convertible I/O and 2 Redundant Solid State Safety Outputs
SC26-2d	XS26-2d	26 convertible I/O and 2 Redundant Solid State Safety Outputs with Display
SC26-2e	XS26-2e	26 convertible I/O and 2 Redundant Solid State Safety Outputs with Ethernet
SC26-2de	XS26-2de	26 convertible I/O and 2 Redundant Solid State Safety Outputs with Display and Ethernet
SC10-2roe		10 Inputs, 2 redundant relay safety outputs (3 contacts each)

10.4 Muting Modules

Model	Mounting	Description
MMD-TA-11B	DIN-mount Muting module	2 N.O. safety outputs (6 amps), 2 or 4 muting inputs, SSI, override input; IP20; terminal connections
MMD-TA-12B		2 OSSD outputs, 2 or 4 muting inputs, SSI, override input; IP20; terminal connections

10.5 AC Boxes

AC power supply for use with EZ-SCREEN emitters and/or receivers. Models **EZAC-R..** can be interfaced with up to three receivers or two cascaded emitter/receiver pairs; models **EZAC-E..** can power up to four emitters. Box supplies +24V dc power at 0.7 amps (16.8 W max. power); accepts input voltages from 100 to 250V ac (50 to 60 Hz); IP65 metal housing.

Models are available with external device monitoring (EDM); key reset switch on **EZAC-R..** models (Emitter/Receiver models). See datasheet p/n 120321 for more information.

Emitter/Receiver Boxes					
Model	Outputs	EDM	Emitter/Receiver Connection	AC Power Connection	Output and EDM Connections
EZAC-R9-QE8	3 N.O.	Selectable 1- or 2-Channel or no EDM	8-Pin M12 Euro-style QD	Hard-wired	Hard-wired
EZAC-R11-QE8	2 N.O., 1 N.C.				
EZAC-R15A-QE8-QS83	1 N.O. + 1 SPDT (Form C)	1-Channel		3-pin Mini-style QD	8-pin Mini-style QD
EZAC-R8N-QE8-QS53	1 N.O., 1 N.C.	Power Monitoring			
EZAC-R10N-QE8-QS53	2 N.O.				

Emitter-Only Boxes			
Model	For Emitter Models	Emitter Connection	AC Power Connection
EZAC-E-QE8	SLPE...Q8 (without Test input)	8-Pin M12 Euro-style QD	Hard-wired
EZAC-E-QE5	SLSE...Q5 (with Test input)	5-Pin M12 Euro-style QD	
EZAC-E-QE8-QS3	SLPE...Q8 (without Test input)	8-Pin M12 Euro-style QD	3-Pin Mini-style QD
EZAC-E-QE5-QS5	SLSE...Q5 (with Test input)	5-Pin M12 Euro-style QD	5-Pin Mini-style QD

10.6 Remote Reset Switch

Model	Description
EZA-RR-1	External normally open reset switch with 8-pin M12/Euro-style quick disconnect fitting; can be interconnected using cordset models QDE-8..D, DEE2R-8..D, or CSB...M1281.

10.7 Lens Shields

Adhesive-Backed Model ²¹	Snap-On Model ²²	Sensor Defined Area ²³	
EZS-150	EZSS-150	150 mm (5.9 in)	
EZS-300	EZSS-300	300 mm (11.8 in)	
EZS-450	EZSS-450	450 mm (17.7 in)	
EZS-600	EZSS-600	600 mm (23.6 in)	
EZS-750	EZSS-750	750 mm (29.5 in)	
EZS-900	EZSS-900	900 mm (35.4 in)	
EZS-1050	EZSS-1050	1050 mm (41.3 in)	
EZS-1200	EZSS-1200	1200 mm (47.2 in)	
EZS-1350	EZSS-1350	1350 mm (53.1 in)	
EZS-1500	EZSS-1500	1500 mm (59.1 in)	
EZS-1650	EZSS-1650	1650 mm (65.0 in)	
EZS-1800	EZSS-1800	1800 mm (70.9 in)	

²¹ Polycarbonate shield guards against weld splatter and weld flash with an adhesive-backed neoprene gasket (see data sheet p/n 61960).

²² Copolyester shield provides heavy-duty, impact-resistant protection from many types of cutting fluids (see data sheet p/n 127944).

²³ Contact Banner Engineering for lens shield availability for longer sensor lengths.

Adhesive-Backed Model ²¹	Snap-On Model ²²	Sensor Defined Area ²³	
The total sensing range decreases by approximately 10% per shield.			

10.8 Tubular Enclosures

When using a tubular enclosure with an MSA series stand (datasheet p/n 117107), the EZA-MBK-2 adapter bracket is required. Explosion-proof enclosures are also available.

Enclosure Model ²⁴	Enclosure Height	For EZ-SCREEN Models	
EZA-TE-150	439 mm (17.3 in)	SLS..-150	
EZA-TE-300	541 mm (21.3 in)	SLS..-300	
EZA-TE-450	744 mm (29.3 in)	SLS..-450	
EZA-TE-600	846 mm (33.3 in)	SLS..-600	
EZA-TE-750	1024 mm (40.3 in)	SLS..-750	
EZA-TE-900	1151 mm (45.3 in)	SLS..-900	
EZA-TE-1050	1354 mm (53.3 in)	SLS..-1050	
EZA-TE-1200	1455 mm (57.3 in)	SLS..-1200	
EZA-TE-1350	1608 mm (63.3 in)	SLS..-1350	
EZA-TE-1500	1760 mm (69.3 in)	SLS..-1500	
EZA-TE-1650	1913 mm (75.3 in)	SLS..-1650	
EZA-TE-1800	2065 mm (81.3 in)	SLS..-1800	

10.9 MSA Series Stands

- Provides mounting T-slots with 20 mm dimension between slots
- Base included. Available without a base by adding the suffix **NB** to the model number (for example, **MSA-S42-1NB**).

Stand Model	Pole Height	Useable Stand Height	Overall Stand Height
MSA-S24-1	610 mm (24 in)	483 mm (19 in)	616 mm (24.25 in)
MSA-S42-1	1067 mm (42 in)	940 mm (37 in)	1073 mm (42.25 in)
MSA-S66-1	1676 mm (66 in)	1550 mm (61 in)	1682 mm (66.25 in)
MSA-S84-1	2134 mm (84 in)	2007 mm (79 in)	2140 mm (84.25 in)
MSA-S105-1	2667 mm (105 in)	2667 mm (100 in)	2673 mm (105.25 in)

²¹ Polycarbonate shield guards against weld splatter and weld flash with an adhesive-backed neoprene gasket (see data sheet p/n 61960).
²² Copolyester shield provides heavy-duty, impact-resistant protection from many types of cutting fluids (see data sheet p/n 127944).
²³ Contact Banner Engineering for lens shield availability for longer sensor lengths.
²⁴ Contact Banner Engineering for enclosure availability for longer sensor lengths.

10.10 MSM Series Corner Mirrors

- Compact for light-duty applications
- Rear-surface glass mirrors are rated at 85% efficiency. The total sensing range decreases by approximately 8% per mirror. See mirror data sheet p/n 43685 or <http://www.bannerengineering.com> for further information.
- Mounting brackets may be inverted from the positions shown (flanges pointing "inward" instead of "outward," as shown). When this is done, dimension L1 decreases by 57 mm.
- MSAMB adapter bracket kit included with each MSA stand.

Mirror Model	Defined Area Length	Reflective Area Y	Mounting L1	Mounting L2	
MSM8A	150 mm (5.9 in)	267 mm (10.5 in)	323 mm (12.7 in)	292 mm (11.5 in)	
MSM12A	300 mm (11.8 in)	356 mm (14 in)	411 mm (16.2 in)	381 mm (15 in)	
MSM20A	450 mm (17.7 in)	559 mm (22 in)	615 mm (24.2 in)	584 mm (23 in)	
MSM24A	600 mm (23.6 in)	660 mm (26 in)	716 mm (28.2 in)	686 mm (27 in)	
MSM32A	750 mm (29.5 in)	864 mm (34 in)	919 mm (36.2 in)	889 mm (35 in)

10.11 SSM Series Corner Mirrors

- Robust for heavy-duty applications
- Extra wide for use with long-range optical safety systems
- Rear-surface glass mirrors are rated at 85% efficiency. The total sensing range decreases by approximately 8% per mirror. See mirror datasheet p/n 61934 or www.bannerengineering.com for further information.
- Stainless steel reflective surface models are also available. See datasheet p/n 67200.
- Robust construction, two mounting brackets and hardware included.
- EZA-MBK-2 adapter bracket is required for use with MSA Series stand, refer to the mounting bracket accessories list.
- Brackets may be inverted from the positions shown, decreasing dimension L1 by 58 mm (2.3 in).

Mirror Model ²⁵	Defined Area Length	Reflective Area Y	Mounting 1	Mounting L2	
SSM-200	150 mm (5.9 in)	200 mm (7.9 in)	278 mm (10.9 in)	311 mm (12.2 in)	
SSM-375	300 mm (11.8 in)	375 mm (14.8 in)	486 mm (19.1 in)	453 mm (17.8 in)	
SSM-550	450 mm (17.7 in)	550 mm (21.7 in)	661 mm (26.0 in)	628 mm (24.7 in)	
SSM-675	600 mm (23.6 in)	675 mm (26.6 in)	786 mm (31.0 in)	753 mm (29.6 in)	
SSM-825	750 mm (29.5 in)	825 mm (32.5 in)	936 mm (36.9 in)	903 mm (35.6 in)	
SSM-975	900 mm (35.4 in)	975 mm (38.4 in)	1086 mm (42.8 in)	1053 mm (41.5 in)	
SSM-1100	1050 mm (41.3 in)	1100 mm (43.3 in)	1211 mm (47.7 in)	1178 mm (46.4 in)	
SSM-1275	1200 mm (47.2 in)	1275 mm (50.2 in)	1386 mm (54.6 in)	1353 mm (53.3 in)	
SSM-1400	1350 mm (53.1 in)	1400 mm (55.1 in)	1511 mm (59.5 in)	1478 mm (58.2 in)	
SSM-1550	1500 mm (59.0 in)	1550 mm (61.0 in)	1661 mm (65.4 in)	1628 mm (64.1 in)	
SSM-1750	1650 mm (65.0 in)	1750 mm (68.9 in)	1861 mm (73.3 in)	1828 mm (72.0 in)	
SSM-1900	1800 mm (70.9 in)	1900 mm (74.8 in)	2011 mm (79.2 in)	1978 mm (77.9 in)	

10.12 Mounting Brackets

See [Replacement Parts](#) on p. 90 for standard brackets. Contact Banner Engineering for more information. **Order one EZA-MBK-.. bracket per sensor, two per pair.**

EZA-MBK-2

- Adapter bracket for mounting SSM series mirror to MSA series stands

Hole center spacing: A = 63.9, B = 19.9, A to B = 22.0

Hole size: A = \varnothing 8.3, B = \varnothing 4.8

EZA-MBK-15

- Retrofit for STI MS46/47, Keyence PJ-V, SUNX SF4-AH

Hole center spacing: A =

Hole size: \varnothing

EZA-MBK-8

- Retrofit for Sick FGS and Leuze L-bracket

Hole center spacing: A =

Hole size: \varnothing

EZA-MBK-18

- Retrofit for Dolan-Jenner SS7

Hole center spacing: A =

Hole size: \varnothing

²⁵ Stainless steel reflective surface models are available by adding model number suffix “-S” (for example, **SSM-375-S**); range reduction for these models is approximately 30% per mirror. See datasheet p/n 67200.

EZA-MBK-13

- Retrofit for Sick C4000, AB SafeShield/GuardShield, Omron FS3N, STI MC42/47

Hole center spacing: A =

Hole size: \varnothing

EZA-MBK-20

- Adapter brackets for mounting to engineered/slotted aluminum framing such as 80/20™ and Unistrut™. Angled slots allow mounting to 20 mm to 40 mm dual channel and center slot. allows mounting to single channel framing
- Retrofit for Banner MINI-SCREEN®
- Order EZA-MBK-20U for bracket with M5 and M6 mounting hardware

Hole center spacing: A = 44.4, B = 20, C = 40

Hole size: A = 10.2 × 4.8; B, C = 25 × 7; D = \varnothing 21.5

EZA-MBK-14

- Retrofit for STI MS4300

Hole center spacing: A =

Hole size: \varnothing

EZA-MBK-21

- Mounting bracket system for L configuration of two cascaded EZ-SCREEN light screens
- M5 and M6 mounting hardware

10.13 Alignment Aids

Model	Description	
LAT-1-SS	Self-contained visible-beam laser tool for aligning any EZ-SCREEN 14 mm and 30 mm emitter/receiver pair. Includes retroreflective target material and mounting clip.	
EZA-LAT-SS	Replacement adaptor (clip) hardware for SLS.. models	
EZA-LAT-2	Clip-on retroreflective LAT target	
BRT-THG-2-100	2 in retroreflective tape, 2.5 m (100 in)	
BT-1	Beam Tracker	

10.14 EZ-LIGHT® for EZ-SCREEN®

Provides clear, 360° indication of the of the EZ-SCREEN receiver's output status. Use with a CSB splitter cable and optional DEE2R double-ended cables. See data sheet p/n 121901 for more information.

Models		Construction	Connector/LED Function/Inputs
	M18RGX8PQ8 ²⁶	Nickel-plated brass housing, M18x1 thread; thermoplastic lens Fully encapsulated IP67	8-pin Euro-style Integral QD Red/Green indication follows OSSD output of the EZ-SCREEN receiver ON Red: —Power ON Beam Blocked or Lockout ON Green: —Power ON Beam Clear PNP (Sourcing)
	T18RGX8PQ8	Thermoplastic polyester housing, thermoplastic lens Fully encapsulated IP67	
	T30RGX8PQ8		
	K30LRGX8PQ8	Polycarbonate housing, 30 mm thermoplastic dome, 22 mm base mount Fully encapsulated, IP67	
	K50LRGX8PQ8	Polycarbonate housing, 50 mm thermoplastic dome, 30 mm base mount Fully encapsulated, IP67	
	K80LRGX8PQ8	Polycarbonate housing, 50 mm thermoplastic dome, flat or DIN mount Encapsulated electronics, IP67	

²⁶ Available in a kit that includes one M18 EZ-LIGHT, one SMB18A mounting bracket, and hardware for mounting to the side channel of an EZ-SCREEN housing (kit model number **EZA-M18RGX8PQ8**).

11 Product Support and Maintenance

11.1 Replacement Parts

Model	Description	
MGA-KSO-1	Panel-mount keyed reset switch	
MGA-K-1	Replacement key for switch MGA-KSO-1	
EZA-ADE-1	Access cover with label – emitter	
EZA-ADR-1	Access cover with label – receiver	
EZA-ADE-2	Access cover with inverted label – emitter	
EZA-ADR-2	Access cover with inverted label – receiver	
EZA-TP-1	Access cover security plate (includes 2 screws, wrench)	
EZA-HK-1	Wrench, security	
STP-13	14 mm test piece (for 14 mm resolution systems)	
STP-14	30 mm test piece (for 30 mm resolution systems)	
STP-15	60 mm test piece (for 30 mm resolution systems with 2-beam Reduced Resolution)	
EZA-RTP-1	Terminator plug for cascaded receiver	
EZA-ECC-10	Dust cap for cascaded emitter	
EZA-MBK-11	Black	Standard bracket kit with hardware. Includes 2 end brackets and hardware to mount to MSA Series stands.
EZA-MBK-11N	Stainless Steel	
EZA-MBK-12	Black	Center bracket kit. Includes 1 bracket and hardware to mount to MSA Series stands), and retrofit for SICK and Leuze Swivel.
EZA-MBK-12N	Stainless Steel	
SMA-MBK-1	SSM Mirror bracket kit. Includes 2 replacement brackets for one mirror.	

11.2 Cleaning

EZ-SCREEN components are constructed of aluminum with a yellow painted finish and are rated IEC IP65. Lens covers are acrylic. Components are best cleaned using mild detergent or window cleaner and a soft cloth. Avoid cleaners containing alcohol, as they may damage the acrylic lens covers.

11.3 Warranty Service

Contact Banner Engineering for troubleshooting of this device. **Do not attempt any repairs to this Banner device; it contains no field-replaceable parts or components.** If the device, device part, or device component is determined to be defective by a Banner Applications Engineer, they will advise you of Banner's RMA (Return Merchandise Authorization) procedure.

Important: If instructed to return the device, pack it with care. Damage that occurs in return shipping is not covered by warranty.

11.4 Manufacturing Date

Every EZ-SCREEN produced is marked with a code that defines the week and year of manufacture and manufacturing location. The code format (U.S. Standard format) is: **YYWWL**

- YY = Year of manufacture, 2 digits
- WW = Week of manufacture, 2 digits
- L = Banner-specific code, 1 digit

Example: 1809H = 2018, Week 9.

11.5 Disposal

Devices that are no longer in use should be disposed of according to the applicable national and local regulations.

11.6 Contact Us

Banner Engineering Corporate headquarters is located at:

9714 Tenth Avenue North
Minneapolis, MN 55441, USA
Website: www.bannerengineering.com
Phone: + 1 888 373 6767

For worldwide locations and local representatives, visit www.bannerengineering.com.

11.7 Banner Engineering Corp Limited Warranty

Banner Engineering Corp. warrants its products to be free from defects in material and workmanship for one year following the date of shipment. Banner Engineering Corp. will repair or replace, free of charge, any product of its manufacture which, at the time it is returned to the factory, is found to have been defective during the warranty period. This warranty does not cover damage or liability for misuse, abuse, or the improper application or installation of the Banner product.

THIS LIMITED WARRANTY IS EXCLUSIVE AND IN LIEU OF ALL OTHER WARRANTIES WHETHER EXPRESS OR IMPLIED (INCLUDING, WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE), AND WHETHER ARISING UNDER COURSE OF PERFORMANCE, COURSE OF DEALING OR TRADE USAGE.

This Warranty is exclusive and limited to repair or, at the discretion of Banner Engineering Corp., replacement. **IN NO EVENT SHALL BANNER ENGINEERING CORP. BE LIABLE TO BUYER OR ANY OTHER PERSON OR ENTITY FOR ANY EXTRA COSTS, EXPENSES, LOSSES, LOSS OF PROFITS, OR ANY INCIDENTAL, CONSEQUENTIAL OR SPECIAL DAMAGES RESULTING FROM ANY PRODUCT DEFECT OR FROM THE USE OR INABILITY TO USE THE PRODUCT, WHETHER ARISING IN CONTRACT OR WARRANTY, STATUTE, TORT, STRICT LIABILITY, NEGLIGENCE, OR OTHERWISE.**

Banner Engineering Corp. reserves the right to change, modify or improve the design of the product without assuming any obligations or liabilities relating to any product previously manufactured by Banner Engineering Corp. Any misuse, abuse, or improper application or installation of this product or use of the product for personal protection applications when the product is identified as not intended for such purposes will void the product warranty. Any modifications to this product without prior express approval by Banner Engineering Corp will void the product warranties. All specifications published in this document are subject to change; Banner reserves the right to modify product specifications or update documentation at any time. Specifications and product information in English supersede that which is provided in any other language. For the most recent version of any documentation, refer to: www.bannerengineering.com.

For patent information, see www.bannerengineering.com/patents.

12 Glossary

A

ANSI (American National Standards Institute)

Acronym for the American National Standards Institute, an association of industry representatives that develops technical standards (including safety standards). These standards comprise a consensus from a variety of industries on good practice and design. ANSI standards relevant to application of safety products include the ANSI B11 Series, and ANSI/RIA R15.06. See [Standards and Regulations](#) on p. 6.

Auto Power-Up

A safety light screen system feature that enables the system to be powered up into Run mode (or recover from a power interruption) without requiring a manual reset.

B

Blanking

A programmable feature of a safety light screen system which allows the light screen to ignore certain objects located within the defined area. See **Floating Blanking** and **Reduced Resolution**.

Blocked Condition

A condition that occurs when an opaque object of sufficient size blocks/interrupts one or more light screen beams. When a blocked condition occurs, OSSD1 and OSSD2 outputs simultaneously turn off within the system response time.

Brake

A mechanism for stopping, slowing, or preventing motion.

C

Cascade

Series connection (or "daisy-chaining") of multiple emitters and receivers.

CE

Abbreviation for "Conformité Européenne" (French translation of "European Conformity"). The CE mark on a product or machine establishes its compliance with all relevant European Union (EU) Directives and the associated safety standards.

Clutch

A mechanism that, when engaged, transmits torque to impart motion from a driving member to a driven member.

Control Reliability

A method of ensuring the performance integrity of a control system or device. Control circuits are designed and constructed so that a single failure or fault within the system does not prevent the normal stopping action from being applied to the machine when required, or does not create unintended machine action, but does prevent initiation of successive machine action until the failure is corrected.

CSA

Abbreviation for Canadian Standards Association, a testing agency similar to Underwriters Laboratories, Inc. (UL) in the United States. A CSA-certified product has been type-tested and approved by the Canadian Standards Association as meeting electrical and safety codes.

D

Defined Area

The "screen of light" generated by a safety light screen system, defined by the height and the safety distance (minimum distance) of the system.

Designated Person

A person or persons identified and designated in writing, by the employer, as being appropriately trained and qualified to perform a specified checkout procedure.

E

Emitter

The light-emitting component of a safety light screen system, consisting of a row of synchronized modulated LEDs. The emitter, together with the receiver (placed opposite), creates a "screen of light" called the defined area.

External Device Monitoring (EDM)

A means by which a safety device (such as a safety light screen) actively monitors the state (or status) of external devices that may be controlled by the safety device. A lockout of the safety device will result if an unsafe state is detected in the external device. External device(s) may include, but are not limited to: MPCEs, captive contact relays/contactors, and safety modules.

F

Failure to Danger

A failure which delays or prevents a machine safety system from arresting dangerous machine motion, thereby increasing risk to personnel.

Final Switching Device (FSD)

The component of the machine's safety-related control system that interrupts the circuit to the machine primary control element (MPCE) when the output signal switching device (OSSD) goes to the OFF-state.

Fixed Blanking

A programming feature that allows a safety light screen system to ignore objects (such as brackets or fixtures) which will always be present at a specific location within the defined area. The presence of these objects will not cause the system's safety outputs (for example, Final Switching Devices) to trip or latch. If any fixed objects are moved within or removed from the defined area, a Lockout condition results.

Floating Blanking

See **Reduced Resolution**.

FMEA (Failure Mode and Effects Analysis)

A testing procedure by which potential failure modes in a system are analyzed to determine their results or effects on the system. Component failure modes that produce either no effect or a Lockout condition are permitted; failures which cause an unsafe condition (a failure to danger) are not. Banner safety products are extensively FMEA tested.

G

Guarded Machine

The machine whose point of operation is guarded by the safety system.

H

Hard (Fixed) Guard

Screens, bars, or other mechanical barriers affixed to the frame of the machine intended to prevent entry by personnel into the hazardous area(s) of a machine, while allowing the point of operation to be viewed. The maximum size of the openings is determined by the applicable standard, such as Table O-10 of OSHA 29CFR1910.217, also called a "fixed barrier guard."

Harm

Physical injury or damage to the health of people, which may result through direct interaction with the machine or through indirect means, as a result of damage to property or to the environment.

Hazard Point

The closest reachable point of the hazardous area.

Hazardous Area

An area that poses an immediate or impending physical hazard.

I

Internal Lockout

A Lockout condition that is due to an internal safety system problem. Generally, indicated by the red Status indicator LED (only) flashing. Requires the attention of a Qualified Person.

K

Key Reset (Manual Reset)

A key-operated switch used to reset a safety light screen system to Run mode following a Lockout condition, or to enable machine operation following a Manual Start/Restart (Latch) condition. Also refers to the act of using the switch.

L

Manual Start/Restart (Latch) Condition

The safety outputs of a safety light screen system turn off when an object completely blocks a beam. In a Manual Start/Restart condition, the safety outputs stay off when the object is removed from the defined area. To re-energize the outputs, perform a proper manual reset.

Lockout Condition

A safety light screen condition that is automatically attained in response to certain failure signals (an internal lockout). When a Lockout condition occurs, the safety light screen's safety outputs turn Off; the failure must be corrected and a manual reset is required to return the system to Run mode.

M

Machine Primary Control Element (MPCE)

An electrically powered element, external to the safety system, which directly controls the machine's normal operating motion in such a way that the element is last (in time) to operate when machine motion is either initiated or arrested.

Machine Response Time

The time between the activation of a machine stopping device and the instant when the dangerous parts of the machine reach a safe state by being brought to rest.

Minimum Object Sensitivity (MOS)

The minimum-diameter object that a safety light screen system can reliably detect. Objects of this diameter or greater will be detected anywhere in the defined area. A smaller object can pass undetected through the light if it passes exactly midway between two adjacent light beams. Also known as MODS (Minimum Object Detection Size). See also **Specified Test Piece**.

Muting

The automatic suspension of the safeguarding function of a safety device during a non-hazardous portion of the machine cycle.

O

Off State

The state in which the output circuit is interrupted and does not permit the flow of current.

On State

The state in which the output circuit is complete and permits the flow of current.

OSHA (Occupational Safety and Health Administration)

A U.S. Federal agency, Division of the U.S. Department of Labor, that is responsible for the regulation of workplace safety.

OSSD

Output Signal Switching Device. The safety outputs that are used to initiate a stop signal.

P

Part-Revolution Clutch

A type of clutch that may be engaged or disengaged during the machine cycle. Part-revolution clutched machines use a clutch/brake mechanism, which can arrest machine motion at any point in the stroke or cycle.

Pass-Through Hazard

A pass-through hazard is associated with applications where personnel may pass through a safeguard (which issues a stop command to remove the hazard), and then continues into the guarded area, such as in perimeter guarding. Subsequently, their presence is no longer detected, and the related danger becomes the unexpected start or restart of the machine while personnel are within the guarded area.

Point of Operation

The location of a machine where material or a workpiece is positioned and a machine function is performed upon it.

PSDI (Presence-Sensing Device Initiation)

An application in which a presence-sensing device is used to actually start the cycle of a machine. In a typical situation, an operator manually positions a part in the machine for the operation. When the operator moves out of the danger area, the presence sensing device starts the machine (no start switch is used). The machine cycle runs to completion, and the operator can then insert a new part and start another cycle. The presence sensing device continually guards the machine. Single-break mode is used when the part is automatically ejected after the machine operation. Double-break mode is used when the part is both inserted (to begin the operation) and removed (after the operation) by the operator. PSDI is commonly confused with "Trip Initiate." PSDI is defined in OSHA CFR1910.217. Banner safety light screen systems may not be used as PSDI devices on mechanical power presses, per OSHA regulation 29 CFR 1910.217.

Q

Qualified Person

A person who, by possession of a recognized degree or certificate of professional training, or who, by extensive knowledge, training and experience, has successfully demonstrated the ability to solve problems relating to the subject matter and work.

R

Receiver

The light-receiving component of a safety light screen system, consisting of a row of synchronized phototransistors. The receiver, together with the emitter (placed opposite), creates a "screen of light" called the defined area.

Reduced Resolution

A feature that allows a safety light screen system to be configured to produce an intentionally disabled light beam(s) within the light screen, which increases the minimum object sensitivity. The disabled beam(s) appears to move up and down (float) to allow the feeding of an object through the defined area at any point without tripping the safety outputs (for example, OSSDs) and causing a Auto Start/Restart (Trip) or Manual Start/Restart (Latch) condition. Sometimes called Floating Blanking.

Reset

The use of a manually operated switch to restore the safety outputs to the On state from a lockout or a Manual Start/Restart (Latch) condition.

Resolution

See **Minimum Object Sensitivity**.

S

Self-Checking (Circuitry)

A circuit with the capability to electronically verify that all of its own critical circuit components, along with their redundant backups, are operating properly. Banner safety light screen systems and safety modules are self-checking.

Safety Distance

The minimum distance required to allow the machine's hazardous motion to stop completely, before a hand (or other object) can reach the nearest hazard point. Measured from the midpoint of the defined area to the nearest hazard point. Factors that influence minimum separation distance include the machine stop time, the light screen system response time, and the light screen minimum object detection size.

Specified Test Piece

An opaque object of sufficient size used to block a light beam to test the operation of a safety light screen system. When inserted into the defined area and placed in front of a beam, the test piece causes the outputs to de-energize.

Supplemental Guarding

Additional safeguarding device(s) or hard guarding, used to prevent a person from reaching over, under, through or around the primary safeguard or otherwise accessing the guarded hazard.

T

Test Piece

An opaque object of sufficient size used to block a light beam to test the operation of a safety light screen system.

Auto Start/Restart (Trip) Condition

The safety outputs of a safety light screen system turn off when an object completely blocks a beam. In an Auto Start/Restart condition, the safety outputs re-energize when the object is removed from the defined area.

Auto Start/Restart (Trip) Initiate

The resetting of a safeguard causing the initiation of machine motion or operation. Auto Start/Restart Initiate is not allowed as a means to initiate a machine cycle per NFPA 79 and ISO 60204-1, and is commonly confused with PSDI.

U

UL (Underwriters Laboratory)

A third-party organization that tests products for compliance with appropriate standards, electrical codes, and safety codes. Compliance is indicated by the UL listing mark on the product.
